Mr. D. A. TOMPKINS.

E. DANA DURAND, *Secretary.*

[Extract from act of Congress of June 18, 1898, defining the duties of the Industrial Commission and showing the scope of its inquiries.]

SEC. 2. That it shall be the duty of this commission to investigate questions pertaining to immigration, to labor, to agriculture, to manufacturing, and to business, and to report to Congress and to suggest such legislation as it may deem best upon these subjects.

SEC. 3. That it shall furnish such information and suggest such laws as may be made a basis for uniform legislation by the various States of the Union, in order to harmonize conflicting interests and to be equitable to the laborer, the employer, the producer, and the consumer.

LETTER OF TRANSMITTAL.

INDUSTRIAL COMMISSION,
December 5, 1901.

To the Fifty-seventh Congress:

I have the honor to transmit herewith, on behalf of the Industrial Commission, a report to Congress on the subject of Education, prepared in conformity with an act of Congress of June 18, 1898.

The conclusions and recommendations of the Commission on this subject will be presented in its final report.

Respectfully,

ALBERT CLARKE, *Chairman.*

INDEX OF TESTIMONY	245

REVIEW OF THE EVIDENCE.

INTRODUCTION.

There is much evidence on education, especially with reference to industrial training, in Volumes VII and XIV (Manufactures and General Business), and, as regards agricultural education, in Volume X (Agriculture). Reference should be made to the digests of those volumes. The testimony of all witnesses before the Commission, especially educators, who discuss education as the sole or main topic, is brought together in this volume, which also contains, however, considerable evidence on subjects not directly connected with education, especially the condition of the negroes and economic conditions in the South generally. In the testimony of some of the witnesses, for example, Dr. Harris and President Dabney, the subject of education is related to the industrial organization of society, even where the testimony does not deal specifically with industrial or technical training. Thus President Dabney shows by statistical comparisons that a community's industrial productivity is about in proportion to the attention it gives to the education of youth, and points out that the interests of pure science and of technology are to a large extent identical; that the study of science and its application must go hand in hand, and that new truths in science always lead to new developments in industry. He calls attention to the debt of civilization to technical knowledge, and maintains that such knowledge must form a part of the higher education.¹

Dr. Harris emphasizes the industrial and political importance of literacy, pointing out that the ability to read and write enables a workman to follow written or printed directions, and that popular opinion can be effective only through books and newspapers, while thorough discussion by the press counteracts the effects of injurious social theories.² While he thus lays much stress upon the importance of a literary education, Dr. Harris maintains that there should be enough industrial schools to enable any person to learn all a school can teach regarding the main industry of his community.³

Mr. Winter, a journalist of Boston, says the native New Englander is becoming a distributor instead of a creator of wealth, and is being supplanted by the thrifty foreigner in the latter capacity because of the lack of technical education. Mr. Winter contrasts American education with that of European countries by saying that while Europe educates the intelligent few and neglects the masses, the United States educates the masses and leaves the intelligent few to get their education as best they can; and he criticises the American system by saying that the only class trained for the work they are to do in this country are those in the professions, constituting only about 5 per cent of the population.⁴

Dr. Dabney, however, remarks that one of the difficulties with the educational system of the South has been that relatively too much emphasis has been laid upon higher education and too little attention given to the public schools. The common-school education, he says, should lay the foundation for any occupation—manual, clerical, or professional. Dr. Dabney agrees with Dr. Harris that universal public education is even more important than technical education.⁵

GENERAL EDUCATION IN THE UNITED STATES.

Dr. Harris submits a table showing, among other things, the school age in the various States of the Union, from which it appears that, although the school age recognized by the Census Office is from 5 to 18 years, the actual school age in the various States in no case corresponds to that period, but varies greatly, being from 6 to 21 years in more than one-third of the States, from 5 to 21 in several others, from 6 to 18 years in some cases, and from 6 to 20 years in a few others. The average amount of schooling given to each inhabitant of the country by all schools, public and private, is estimated to be nearly 5 years of 200 days each; but in the rural districts, at least in the South, the school year is usually limited to 3 or 4 months. The total number of school days has been gradually increased, owing chiefly to the growth of towns and cities and the increase in the wealth of the country. Thus in the South the average school term has increased since 1870 from 94 days to 108 days.

Compulsory education.—A large number of the States have compulsory attendance laws for children between certain ages, usually a shorter period, however, than the number of years included in what is known as the school age, that is, the age at which children are permitted to attend school.¹ Some witnesses favor the extension of compulsory education to the Southern States,² but in opposition to this proposal it is argued that the educational system of some of the Southern States has not reached such a state of perfection as would warrant a compulsory attendance law applying to the entire State, though it might be applied to towns and cities. It would be a hardship to require children to go such long distances as would be necessary in many cases in the rural districts unless the districts were divided up.³

Free transportation of pupils.—Many of the States have recently made vigorous efforts to improve the schools in the rural districts, especially by providing free transportation of the pupils to centrally located schools. This has made possible a consolidation of school districts and has resulted in a better quality of instruction and longer school terms. Massachusetts led the way in providing free transportation, and its example has been followed by 13 other States, including nearly the whole of New England and a number of North Central and Western States. It has been found that the cost of transportation is more than made up by the amount saved in teachers' salaries, a smaller number of teachers being necessary. It is pointed out that the educational interests of the rural districts would be materially advanced by the improvement of country roads, which in many cases is necessary before the rural schools can be greatly improved.⁴

Free text-books.—Nine States have laws providing for free text-books, and in 10 others the municipality or school district has the option of providing such books.⁵

Discrimination against negro schools.—There is some evidence tending to show that the school funds in the Southern States are not always equally or proportionally divided between the white and the colored schools; that the latter have poorer buildings and poorer teachers than the white schools; and, moreover, that it is the custom in some places for the white schools to be kept open a longer period than the public funds provide for, by a voluntary contribution or tax paid by the white people. Thus it sometimes happens that the school for whites may be open 8 or 9 months a year, although it is supported by public funds for only a part of this time, while the colored school is open only about 4 months in the year. It is stated that in some places the average colored child can not get an education in the public school sufficient to enable him to read, write, and spell.⁶ On the other hand, there has been a striking development of institutions for the colored race apart from the common school system, usually under denominational or other private auspices, so that the secondary and higher education of the negroes is fairly well provided for.

⁶ Du Bois, pp. 172, 173.

Secondary and higher education.—The number of high schools in the United States has more than doubled during the past decade.¹ Dr. Dabney calls attention to a noticeable change in the character of higher education since about 1870, not only in the United States, but throughout the world. He says the old-time college was deficient in that it did not qualify all its students for their life work. The recent tendency has been in the direction of scientific and technical education, and is in harmony with the trend of modern thought and industrial development.²

Higher education of women.—The higher education of women has been revolutionized during the past quarter of a century. The number of woman college students increased more than two and one-half times during that period. The higher education of labor has resulted in their displacing men in certain employments, to a greater or less extent, e. g. in clerkships and school-teaching. Less than one-third of the teachers in public schools are now men.³ It is pointed out that the woman teachers can not generally be expected to develop the curriculum in the direction of technical education.⁴

TECHNICAL AND INDUSTRIAL EDUCATION.

Testimony on the subject of technical and industrial education is given for the most part by representatives of various educational institutions in which such methods of education are especially prominent. Messrs. Simpson and Beatty, of Clemson College, South Carolina; Dr. Frissell, principal of Hampton Institute, Virginia; Mr. Miller, president of the Colored Normal, Industrial, Agricultural, and Mechanical College of South Carolina; Mr. Winston, president of the North Carolina College of Agriculture and Mechanic Arts, and Mr. R. R. Wright, president of the Georgia State Industrial College, give evidence especially relating to the conditions of technical instruction in the South. Mr. James T. Smith, Mr. Christopher Parkinson Brooks, and Prof. William W. Crosby, officers and teachers in the textile schools at Lowell and New Bedford, testify regarding those institutions. Mr. Winter and Dr. Harris discuss the general features of technical education and manual training, while the other witnesses already named also give some testimony of a general character.

A clear distinction is drawn by the witnesses between manual training, which is conceived to be a proper accompaniment of ordinary public schools, and industrial or technical education proper. Manual training is intended to develop the faculties in general and especially to give accuracy of perception and of execution. In industrial schools special training is given with a view to fitting for trades and professions. One witness further distinguishes trade schools from technical schools in the highest sense. A trade school teaches the technique of industry and fits a man for relatively subordinate positions, while the advanced technical school gives the most thorough training in the scientific principles, fitting men for professional work.⁵

Desirability of manual and industrial training.—All of the witnesses named agree in urging the desirability of furnishing opportunities for both manual and industrial training. One witness suggests that the purpose of trade schools and technical schools ought not to be merely to help the students to get better opportunities for earning a living, but to fit them to become leaders in industry and to furnish examples to others, so that the whole community as well as themselves benefit.⁶

In behalf of manual training it is urged that mere book learning leaves the pupil insufficiently prepared for practical life; that it does not train the hand or the eye. In behalf of trade and technical education it is urged that the old apprenticeship system has largely disappeared, and that at the present time apprentices, even if they are taken at all, are not given a comprehensive training. The United States is rapidly becoming a great factor in the world's markets, and to maintain its place and

⁶ Simpson, pp. 107, 108.

to advance it must have highly skilled workingmen as well as trained foremen and professional managers of industry.¹

Several witnesses lay stress upon the great results accomplished in Germany and England by means of industrial education.² The National Government in Great Britain makes an annual appropriation of \$3,750,000 for technical schools, and 26,000 pupils are attending such schools. The enormous rapidity with which Germany has increased all of her industries, and has lifted herself to the position of the second country of the world in the matter of foreign trade, is attributed in no small degree by these witnesses to the efforts of the Government to promote industrial and commercial education. Among other illustrations of the development of special industries by means of technical education may be mentioned the beet-sugar industry and the dyeing trade. A very considerable proportion of the most skilled workingmen and of the most efficient foremen and superintendents of industrial establishments in Germany have received their training in the technical schools, which aim to give the most complete and practical instruction.

Dr. Harris³ in particular testifies that the movement in favor of manual training and technical education in the United States has been very rapid during the past few years. There are at present 125 industrial or technical schools of different kinds in the country, while 10 years ago there were only 18. In 1899 manual training was a special feature of the public-school course of 170 cities, while in 350 institutions other than city schools there is more or less in the nature of manual training. Massachusetts requires every city of 200,000 inhabitants to maintain manual training courses in the high school, and many other States have passed legislation in favor of the system.

Dr. Dabney, president of the University of Tennessee, and various other witnesses representing Southern educational institutions, speak especially of the great need of industrial education in the South. It is stated that up to the time of the war manual work was considered as beneath the dignity of educated whites, so that still many young people in the South are entirely lacking in fitness to enter trades. The need of technical and agricultural education for members of the colored race is also emphasized. It is pointed out that the South has very great natural opportunities for manufacturing, and that, although she has developed with great rapidity in this regard during recent years, yet as compared with the North, much remains to be done in taking advantage of her opportunities.⁴

SOUTHERN INDUSTRIAL SCHOOLS.

It appears that schools furnishing industrial training are being rapidly introduced in the South. Most of the institutions whose representatives testified before the commission have been established within the past 10 years, and are rapidly expanding their facilities and increasing the number of their students.

Somewhat full descriptions are given in the testimony of the work of Clemson College, South Carolina, and of the North Carolina College of Agriculture and Mechanic Arts.⁵ Both of these give instruction only to whites. They are of relatively high grade, fitting students for professional work in various lines. In each institution there are courses in agriculture, in mechanical, electrical, and civil engineering, and in textile industries. Both institutions receive aid from the United States Government, from the Morrill fund, and also from the land scrip fund, which was given to the States by the Federal Government. Both institutions receive also appropriations from the State governments.

³ Pages 16-33.

⁴ Dabney, pp. 195-197; Simpson, p. 101, 104, 107; Harrison, p. 109.

⁵ Simpson, pp. 101-108; Beaty, pp. 92-100; Winston, pp. 124-132.

The description of the work of these two technical schools shows that thorough practical and theoretical training is given the students. The witnesses assert that the graduates have no difficulty in finding good positions of responsibility, and that in many cases students are called for to take up practical work before they graduate.

Institutions for the colored race.—The principal of the Hampton Normal and Agricultural Institute gives testimony regarding that school,¹ which was started soon after the war, and which educates both Indians and negroes. It numbers about 1,000 students. The institution receives part of the money from the Federal Government going to the State of Virginia, and also considerable amounts from private sources. The work is of a much less advanced character than that of the institutions for whites last described. Students are taken at an early age and are fitted for entrance into trades and for teaching in the common schools. A conspicuous feature of the institution is the large amount of actual work which is required from the pupils, and for which they are paid so as to enable them in part to meet the expense of education. A large proportion of the graduates become teachers, skilled craftsmen, and farmers; and it is asserted that they exercise a highly beneficial influence upon the communities into which they go.

The Colored Normal, Industrial, Agricultural and Mechanical College of South Carolina,² and the Georgia State Industrial College,³ are both institutions for the colored race. Their work is somewhat similar to that of Hampton Institute, involving practical training for earning a living rather than advanced scientific education. Both institutions receive support from the Federal land-grant fund and from their respective States. Both have been established since 1890. In each school a considerable amount of actual work on the farms and in the shops is required, and the students are able to earn part of their expenses.

TEXTILE SCHOOLS.⁴

It appears from the testimony that the legislature of Massachusetts several years ago passed a law permitting the cities having the largest textile interests to establish textile schools, and agreeing to appropriate \$25,000 to each city which should contribute an equal amount for that purpose. The first textile school was established at Lowell and is in successful operation. At the time of the testimony before the commission, 1899, the city of New Bedford was erecting a building for a similar school. The object of these institutions is to furnish a thorough scientific and practical training regarding the textile industry, fitting the graduates for responsible positions in connection with textile factories. It is not the purpose simply to train skilled workmen, but to give, to a certain degree, a professional education. The immense importance of the textile industries in Massachusetts leads witnesses to the belief that this form of education is exceedingly desirable in order to maintain the high position which the State has secured in the markets of the world.

The course in the Lowell textile school provides for instruction especially in decorative art, general chemistry and its application to dyeing and allied processes, and mechanics especially in its application to textile machinery. The completion of the course requires three years. Some students attend only evening classes, while others take work throughout the day. The graduates of this school have already shown its advantages, many of them securing responsible positions.

These Massachusetts textile schools are following in some ways the lead taken by Great Britain and Germany, which have made very marked progress in this direction. At Clemson College, South Carolina, and at the North Carolina College of Agriculture and Mechanic Arts, textile schools have very recently been established, and another is being established in Atlanta. These Southern schools follow the same general methods as are found at Lowell.

· AGRICULTURAL EDUCATION.

While it is generally recognized that the agricultural colleges are doing valuable work in science, there is some criticism to the effect that they have devoted too little attention to practical agriculture.¹ Professor Davenport, of the University of Illinois, goes so far as to say that the Government grants of 1862 and 1890 have done very little good either to agriculture or to the mechanic arts. He recognizes, however, that there were great difficulties connected with the development of agricultural education of college grade. Any new subject has difficulty in establishing itself in an educational institution by the side of old subjects, and, in the case of agriculture, there were no adequate text-books, while the professors of agriculture were apt to be farmers who had been unsuccessful, or chemists who had paid some attention to agriculture.

The State of Illinois has within a few years attempted to insure practical agricultural training by a legislative provision to the effect that one-half the proceeds of the grants of 1862 and 1890 shall be applied to the teaching of technical agriculture, including the matters connected with live stock, crops, horticulture, and veterinary science, as distinguished from the sciences relating to agriculture, such as chemistry, botany, etc. A similar division of funds had already been adopted in Wisconsin by the board of trustees of the university, with very satisfactory results.² There is some difference of opinion as to how far the instruction should be developed on the practical side, Dr. True, chief of the Division of Experiment Stations of the Department of Agriculture, holding that it is not the function of an agricultural college to give training in actual farm work. It seems to be generally agreed, however, that it is desirable to develop agricultural instruction and training in schools below the college grade. It is proposed to lay the foundations of such instruction by means of nature-study in the common schools, the cultural value of which for all pupils is insisted upon, and to give some instruction of a more definitely agricultural character in high schools in rural districts. The need of distinctively agricultural schools, like those at the universities of Minnesota and Nebraska, and at Briarcliff Farms, N. Y., and at Hampton and Tuskegee, in the South, is also emphasized.³

Professor Roberts gives an account of the work done by Cornell University, not only in the College of Agriculture at Ithaca, but also in the extension of agricultural knowledge throughout the State, by means of lectures, reading courses, and nature-study leaflets.

PROPOSED NATIONAL AID.

Several witnesses from the South are strongly in favor of Federal aid for education, and most of them agree in approving the principle of the bill for that purpose introduced in the Fifty-first Congress by Senator Blair. There is much testimony to the effect that the Southern States are doing all they can afford to do in education, but that the school facilities are still very inadequate, not only for the colored children, but for the whites also. While Federal aid is asked for especially for the benefit of the Southern States, and in some cases for the special benefit of the negroes, no distinction of color is proposed so far as the legislation is concerned, the idea being that the appropriation should be made to the various States in proportion to the illiteracy.⁴ Some witnesses ask especially for governmental aid for manual training and industrial education, especially textile schools;⁵ and the need of additional agricultural experiment stations in the Southern States is emphasized. The close connection between textile manufactures and the prosperity of the cotton industry is hinted at, and one witness suggests that the funds due from the United States to unidentified deceased negro soldiers be turned over to the States, in proportion to the number of such soldiers from each, for the establishment and equipment of textile schools. The desirability of a national university also finds expression in the testimony.

TOPICAL DIGEST OF EVIDENCE.

Prepared by HARVEY M. FRIEND.

I. EDUCATION AND PROGRESS.

A. The nature of civilization.—1. *Objects of civilization.*—Dr. HARRIS says that civilization has two important objects: (1) To place under the command of the individual and the whole social fabric the services of nature; (2) to make available to each individual the experience, observations, reflections, insights, etc., of his fellow-men. Civilization relates to a material side and to a spiritual side of life. There has been an enormous advance in the command of the material world by machinery and the forces of steam and electricity, but there has been greater progress made through the agency of the newspaper and the book. It may be that the men of the present time work as hard as the men of the last century, but every hour's labor now produces from four to ten times as great results as each hour did then. The power of the individual citizen to participate in the life and work of his fellow-man has been immensely increased. The condition of the workingman is now far better than it was 50 years ago, because he can command more productions that are useful for his health and comfort, and can share the observations and reflections of his fellow-men upon the problems of life. (48, 49.)

2. *Civilization and progress.*—Dr. DABNEY, president of the University of Tennessee, says that in society, as in biology, there are three states: (1) Equilibrium; (2) evolution or development; and (3) degeneration. A nation may remain in equilibrium for a brief time in the early state of its history, but to stand still after that is to die. The South stands to-day at the beginning of the second state. It has lived as long as it can upon the bounties of nature and has reached that point at which it must study science, learn the arts, use its material resources, and accumulate wealth. The study and the application of science must go hand in hand. The interests of pure science and of technology are largely identical. New truths in science always lead to new developments in industry; hence comes the inventor as well as the investigator. Every advance in industry facilitates the experimental investigation upon which the growth of pure science depends. The glass industry has promoted chemistry and the electrical industry has aided physics and mechanical engineering. It is not the classics or philosophy that makes a people strong. Civilization owes so much to technical knowledge that that knowledge must form a part of the higher education. These opinions are in accord with General Lee's plan for the development of Washington College. (196, 197.)

B. Industrial and political importance of literacy.—Dr. HARRIS argues that the most important thing in education is to make everybody a reader. Every person of proper age should be able to read and write. The illiterate person is not able to work by himself except in the simplest kinds of employment. The educated man can follow written or printed directions, and be held responsible for the character of his work when he is not under immediate supervision. The work of a community gets to be of such a kind as to demand in the laborer a knowledge of reading and writing. The most important thing in a free country is for its inhabitants to be able to read and write, for the reason that the government must be chiefly one of popular opinion, which can be effective only through the newspaper and the book. The individual must learn every day to know the opinions of his fellow-men. Thus there goes on in the mind of each citizen a comparative study of public opinion—the readjustment of local opinion and sentiment to the aggregate of public opinion and sentiment of States and nations. The general public opinion of the world is a kind of "writing on the wall" in which the individual of any particular section weighs his local view of affairs. Ignorance of public opinion leads to useless wars or to useless undertakings. (5.)

Dr. Harris goes on to say that Great Britain is much more influenced by newspapers than any of the nations on the Continent. In this respect it is seen that the Anglo-Saxon people have invented a means for making their individualism safe. The American newspapers far surpass the English newspapers in taking hold of the life of the individual. Information in an English newspaper is served up in the form of elaborate articles, and the colloquial style is avoided. Each reader in America can get far more from his newspaper than the Englishman can get from his. The process of creating public opinion and of reducing conflicting currents of public opinion to one standard are realized more successfully in this country than in any other. A newspaper public opinion, however, can penetrate only educated communities. The newspapers have improved from year to year in their ability to take up great questions and present them intelligibly to people of ordinary education. The socialistic question suggested by Karl Marx in his great work on "Capital," and echoed by Henry George in his book on "Progress and Poverty," that the rich are growing richer and fewer, and the poor are growing poorer and more numerous, can be, and has been, very thoroughly discussed by the press of the country, and the theories of those eminent men refuted. (5, 6.)

C. Education and production.—Dr. DABNEY, quoting from a paper read by him at the Richmond meeting of the Southern Educational Association, says that the chief characteristic of the nineteenth century has been the extension of the benefits of education to the masses of the people. Its chief lesson is that education increases the wealth-producing power of the people in direct proportion to its distribution and thoroughness. The power of the people of the different States to earn money is in direct proportion to the length of the period the average citizen of each has attended school. The average school period for 1898-99 of each inhabitant of the United States was 4.4 years; of Massachusetts, which has the best schools, 7 years; of Tennessee (which is taken as a fair representative of the Southern States), a little less than 3 years. The total annual production of the United States in the year 1800 was less than \$30 a year, or 10 cents a day, for each man, woman, and child. This increased from year to year until in 1899 it was about \$170 a year, or 55 cents a day. The production of Massachusetts in 1899 was \$260, or 85 cents a day, for each man, woman, and child. In Tennessee in 1899 it was less than \$116 a year, or 38 cents a day, for each inhabitant. The average family of 5 in Tennessee must live on \$580 a year, counting everything produced on the farm as well as sales and money wages, while a similar family in Massachusetts has \$1,300 to spend, and the average family of the United States has \$850. The proportion between the school period in Massachusetts, the school period in the whole United States, and the school period in Tennessee is expressed by the ratio 14:8.8:6; the proportion between the productive capacity of each person in Massachusetts, in the whole United States, and in Tennessee is expressed by the ratio 13:8.5:5.8. The witness maintains that these figures are not a mere coincidence, but express a law which is universal the world over.

The population of Massachusetts earned in 1 year \$403,969,824 more than the same number of people in Tennessee. Massachusetts spent \$12,261,525 more upon her public schools than Tennessee in that year; that is, \$12,000,000 invested in superior education yielded \$400,000,000. Tennessee is richer in natural resources by far than Massachusetts, even though Massachusetts has superior waterways; and in order that Tennessee and the whole South may reap the full advantage of those resources it is necessary that all the children, both white and black, in that country should be educated thoroughly through a long series of years. The marvelous energy and common sense of any people is not a sufficient guaranty of their success in the battle of life. In the competition that has come with the twentieth century a thorough training is necessary. (193, 195.)

Dr. HARRIS says the total production of the labor of the people of the United States for 1880 was about 44 cents a day for each person; but the production of Massachusetts, where the average of schooling is 7 years for each inhabitant, was nearly double that for each inhabitant of the United States. The lowest estimate gives 68 per cent more than the national average, while the highest and best estimate gives exactly 100 per cent. He attributes this productive capacity of the people of Massachusetts to the excellent schools in that State, and says that no one can fail to see the relation of the schools of Massachusetts to its phenomenal production of wealth. The excellent school system of Massachusetts has also had a great deal to do with lessening vice in that State. (45.)

According to the census of 1890 the total value of farm products, including live stock, amounted to \$0.108 for each inhabitant of the United States, the manufacturing products to \$0.184, the mining products to \$0.025, or a total for these 3 great items of \$0.3174, or \$2.2218 a week, or \$9.522 per month for each individual. Multiplying by 3 to obtain the representation of the average wage-earner, it appears that

he receives \$6.6654 per week, or \$28.563 a month. Dr. Harris submits a table showing the amount per day per inhabitant by States. Adding to the total amount received from the 3 items mentioned the items of wages for transportation, small gardening, and other industries not taken account of by the census, he finds that the total sum received by each person employed in the United States is \$0.5144 per day, or for each wage-earner \$1.5432 a day, or \$10.80 a week; hence any person receiving \$11 a week receives more than the average wage-earner. Mulhall, in his "Industries and Wealth of Nations," finds that the daily productivity of each inhabitant of the United States is \$0.6025, and of Europe, \$0.2650. Dr. Harris submits a table showing the incomes among all classes in Great Britain, taken from Leone Levi's "Wages," which shows that the number of incomes over \$750 a year increased rapidly between 1850 and 1880; while population increased only 33 per cent, the incomes of from \$750 to \$5,000 trebled, the number of incomes from \$5,000 to \$15,000 more than doubled, and the average of those less than \$750 increased from \$265 in 1850 to \$415 in 1881. The production of the United States has risen from an average of 30 cents per capita in 1850 to nearly 51½ cents in 1890. A table accompanies this testimony showing the sources of this average income. One of the most encouraging signs of improvement is the evidence of the distribution of these aggregate earnings among all classes of people. (9-12.)

II. GENERAL EDUCATION IN THE UNITED STATES.

A. The common school system generally.—1. *Schoolage, school attendance, etc.*—Dr. HARRIS, United States Commissioner of Education, submits tables showing the school age, both permissible and compulsory, in the several States of the Union; also the enrollment and amount expended per capita of population by the several States. The school age recognized by the United States census is from 5 to 18; but in 18 of the States the legal age at which persons are permitted free school attendance is from 6 to 21; in 6 States, from 6 to 18; in 11 States, from 5 to 21; in 4 States, from 6 to 20. Many States have fixed a shorter period for compulsory school attendance.

The actual average attendance indicates what is actually realized in the matter of education in each State. A table is submitted by the witness giving the average and the aggregate attendance in the several States. The school year is regarded as 200 days, but not all of the States have the schools open for that length of time. The total amount of schooling given on an average to each inhabitant of the United States by all schools, public and private, is nearly 5 years of 200 days each. Usually 3 or 4 months is the extent of the school year in the rural districts, and the States that have comparatively few cities average a very small number of days in the school year. In the South Atlantic division the average school year is so short that each inhabitant receives only 3.05 years' education, while the North Atlantic division, which contains the larger cities, is giving to each inhabitant an average of 6.70 years of 200 days each. The total number of school days for the whole country has been gradually increased, owing chiefly to the growth of cities and large villages, the construction of railroads, and the increasing wealth of the country. The growth of villages in the South is an important influence in the lengthening of the school term, which in that section has increased from an average of 94 days in the year 1870 to an average of 108 days in the year 1899.

The percentage of school population in the South from 6 to 18 years of age is larger than in the North; the families are larger and there are fewer old people. By the census of 1880 it was shown that the number of children 6 to 13 years of age, inclusive, was 19.45 for each 100 inhabitants of the whole United States, but in the North Atlantic division only 16.92; in the South Atlantic division 21.37; in the North Central division 19.74; in the South Central division 22.16; and in the Western division only 16.13. A similar ratio prevailed in respect to children from 4 to 20 years of age in the several sections of the country. The witness thinks that the reason the percentage of children is higher in the Southern States than in the Northern grows out of the effects of the civil war, the extraordinary strain in physical and mental exhaustion and the worries and discouragements attendant on the results thereof having caused the percentage of persons over 40 years of age to be much less than the percentage of persons of similar age in the North. (1-5.)

Dr. Harris submits a table showing the enrollment of pupils in the different States in elementary, secondary, and higher institutions of learning. The total number of different pupils enrolled in the public schools for the year 1898-99 was over 15,000,000, or about 20½ per cent of the population. (42-45.)

2. *Comparison with other countries.*—Dr. HARRIS says the United States shows a greater rate of increase in population than any other country, and the number of persons reaching old age is not so great as in some of the countries of Europe. The

result is that the school population from 6 to 18 years is a larger percentage of the total population than it is in European countries. In the United States the percentage of the population which attends school some portion of the year is 21; in England it is about 17; in Germany it is about 18; and in some divisions, say Saxony, 20; in Spain, $7\frac{1}{2}$; in Italy, $7\frac{1}{2}$. A table of comparative statistics of education in the United States and in foreign countries is submitted. After the Franco-Prussian war France, Spain, and Italy made a great effort to bring their children into school. It was thought that universal education in Germany had been a powerful factor in the success of the German arms. The result is that France now has about $14\frac{1}{2}$ per cent of its population in school, whereas before 1875 the schools of that country and of the other European countries enrolled a much smaller proportion of their population. (6-8.)

Mr. WINTER, a journalist of Boston, Mass., says that at the time of the civil war the United States depended upon Russia's aid in furnishing the Massachusetts Institute of Technology, and that the Russian system is carried out in this country to-day to a large extent, especially in railroads, civil engineering, and military schools. Europe educates the intelligent few and neglects the masses; the United States educates the masses and leaves the intelligent few to get their education as best they can. He quotes from Bryce's "American Commonwealth:" "The public elementary school gives everybody the key of knowledge in making reading and writing familiar, but it has no time to tell how to use the key. The education of the masses is a superficial knowledge." In the United States the only class trained for their work are those in the professions, which constitute about 5 per cent of the population. Twenty per cent are in commercial occupations, leaving the remainder in need of industrial and scientific training. The salaries paid in commercial and business pursuits average as follows: Five per cent at \$2,000; 12 per cent at \$1,200; 28 per cent at \$1,000, and 56 per cent at less than \$1,000 per annum. (66, 67.)

3. *Course of study.*—Dr. HARRIS says the course of study in the common schools in nearly all the States includes reading, writing, arithmetic, grammar, history of the United States, miscellaneous lessons in natural science, and a course of lessons in hygiene, especially with reference to intoxicating drinks. The report of the United States Commissioner of Education every year contains a table showing the studies of all the secondary pupils, i. e., those in the high schools and in private academies who are studying Latin, Greek, algebra, and geometry. A table is submitted showing the students in certain studies in secondary schools in 1898-99. (50, 51.)

4. *Free text-books.*—Dr. HARRIS submits 2 tables showing that in 9 States free text-books are provided, and in 10 others the district or town has the option of providing free text-books for pupils within its limits.

5. *Improvement of rural schools.*—Dr. HARRIS says that many of the States have recently improved their rural schools. Ohio has done a good deal, following the example of Kingsville, in Ashtabula County. The State has also passed a law, called the Boxwell law, which provides for certificates of graduation for pupils in rural schools, and makes possible their further education in high schools at the expense of the State.

6. *Free transportation of pupils.*—Dr. HARRIS says the free transportation of pupils to well-graded schools began less than 30 years ago, and within the last few years the movement has spread rapidly. A table is submitted showing that in 14 States free transportation is provided to and from the schools, with certain restrictions. Massachusetts led the way in developing the district system and also in consolidation. An act giving this authority was passed in 1869. A table is submitted showing the amounts appropriated for public-school transportation for the school year from 1888 to 1896 to have increased from \$22,118.38 for the years 1888-89 to \$91,136.11 for the years 1895-96. The movement has extended beyond Massachusetts to nearly every one of the New England States, and many hundreds of schools have been consolidated, with the most gratifying results. Longer school terms, better teachers better grading, better instruction, more interest in the pupils, greater physical comfort on the part of the children, and better supervision have resulted. The new plan is never more expensive than the old one, and is often less expensive. In addition to the New England States, New Jersey, Ohio, New York, Iowa, Nebraska, Pennsylvania, Wisconsin, and North and South Dakota have free transportation with certain limitations. In most States new legislation will be necessary to bring this about. Consolidation of schools does not necessarily mean that there will be only one school in a town or township. It turns practically upon means of cheap, safe and easy communication throughout the school area. At Kingsville, Ohio, where the transportation reached all the pupils, the cost of tuition was reduced from \$22.75 to \$12.25 a year for each of the 50 pupils brought to the central school from the outlying districts.

Massachusetts, Ohio, and some other States have provided for the transportation of pupils from sparsely settled districts to the large schools in villages centrally situated. It is found that the cost of transportation is more than made up by the amount saved in wages of teachers, fewer teachers being able to do better work under the new plan than a greater number under the old plan. The children are transported in a covered conveyance or omnibus, which goes to the remote parts of the district and takes up the children in the morning, conveys them to the school, and returns them to their residences in the afternoon. In some parts of Ohio, where the plan is being tried, the drivers of the omnibuses serve as carriers for the mails between the farmhouses and the post-offices. Dr. Harris thinks there is no rural interest of a social nature that would be more advanced by good roads than the educational interest. In many places road improvement is a necessary condition previous to the betterment of rural schools. (33-36.)

7. *Indian schools.*—Dr. HARRIS says there are in the United States 24 Indian schools, having 262 teachers (116 males and 146 females) and 5,364 pupils (3,076 males and 2,288 females). The total expenditure for these schools approximates \$200,000.

The defect in the education of the Indian lies in the fact that the tribal system (1) does not permit the rise of combinations large enough to give free development to productive industry, and (2) does not permit the ownership of land in severalty. The Indian school at Carlisle teaches the Indian to desire individual ownership of farms and shops, and to specialize his industry. (18, 40.)

B. Common schools in the South. (See also *Education of the Negro*, p. lx.)

1. *North Carolina.*—Mr. WINSTON, president of the North Carolina College of Agriculture and Mechanic Arts, says the school year in North Carolina is 71 days. There is a tendency to prolong the term from year to year, and the appropriation for the public schools has been increased by each successive legislature for the last 10 or 11 years. The school tax at present is 18 cents on each \$100 and \$1.50 poll tax, besides a lump appropriation by a recent legislature of \$100,000. The most efficient schools of the State are those in the towns and small cities which have a special tax. As compared with the condition 10 or 20 years ago, the standard of education among the people generally is decidedly on the increase, and there is a corresponding increase in responsibility. The facilities for higher education in the State are remarkably good, considering the small amount of money that is appropriated for that purpose. The University of North Carolina has an income of not quite \$50,000, and yet graduates from there can secure scholarships from Harvard, and afterwards fellowships in competition with Harvard men. There are about 600 students in the university. There are about a dozen smaller colleges in the State, mostly church colleges, most of which are of really high standard and do creditable work. Mr. Winston does not favor Federal aid for these denominational colleges. (126-127.)

2. *South Carolina.*—Mr. SIMPSON, president of the board of trustees of Clemson College, says there is a great mass of ignorance in South Carolina, among both the white and the colored populations. When the negroes were freed they stepped out of almost abject ignorance and at once become full-fledged citizens, and the very large excess of negroes over whites in South Carolina seriously endangered the existence of the white race. The State thought the best course to pursue was to educate the negroes, who were far more ignorant than the whites, because the white people had had free public schools to a certain extent before the war, so that even among the very poor people there was some smattering of education. The State has been very liberal in its efforts to educate the negro, and it has been a terrible tax upon it—a tax which has kept down the establishment of higher technical institutions. One of the arguments against the establishment of Clemson College was that there was so much taxation already for common-school purposes. A large per cent of the population of South Carolina under 21 years is to-day uneducated, quite a large percentage being unable to read and write; many of the people have had no opportunity of going to school and have no conception of education. In the mountain country there is a great amount of ignorance among the adults. In some sections the white children do not attend the public schools, even for the short period of 3 months, because the parents do not favor it. The negro children really take more kindly to education than the poor white children. (103, 104, 106.)

Mr. HARRISON, a farmer, of Fairview, S. C., says that under the constitution of South Carolina there is a 3-mill property tax and a poll tax levied for the support of the common schools of the State, which can not be devoted to any other purpose. Every school district in the State also has the privilege of levying an additional tax for educational purposes. If a township is too large, its citizens may make application to the county educational board for a division, which is granted in nearly every

instance, so that there is a white and a colored school in each school district. Each school has a board of trustees appointed by the educational board of the county. Nearly every town in the State levies an additional school tax for higher education. The appropriation for higher education in round numbers is about \$200,000 for the State. There is also a tag tax on fertilizers, amounting to about \$50,000 annually, which goes direct to Clemson College. With a few exceptions the people of the State avail themselves of all the opportunities for education that are afforded. There are a few who do not send their children to school, but that class is very small. In some families where there are a number of children, perhaps 3 or 4, will go to school one year and the others the next year. The schools ought to run 8 or 9 months, whereas they run only 3 or 4 months in the year. The school system is not what it ought to be, but is perhaps as good as the State can afford. (108, 109.)

Mr. Harrison says more than three-fourths of the school tax of South Carolina is paid by the white race. The amount appropriated is divided per capita among all the children. The enrolled attendance of one year is the basis of the appropriation for the following year. The colored population in the schools is in the proportion of about 4 to 6. (110.)

Mr. Harrison says that Citadel Academy is the only place in South Carolina where a boy can get a free education. The institution is supported by the State, and the pupils are boarded, clothed, and have free tuition. It is a business education with a military feature. The State appropriates money enough to support 2 beneficiary scholars from each county, and there are also students there who pay. (110.)

This witness also says that there are private schools in the State which are, of course, subject to the public schools. For instance, after the public schools have continued several months in the year the patrons of the school will arrange to continue the school for a longer period and will raise the necessary funds for that purpose. (110.)

Denominational schools.—Mr. Harrison says that almost every denomination has high schools in South Carolina; there are more for women than for men. He thinks that so far as literary institutions are concerned the State of South Carolina is amply supplied, but believes she is deficient in common schools and in the industrial and manual-training schools. (110, 111.)

Mr. MILLER, the president of the Colored Normal, Industrial, Agricultural and Mechanical College of South Carolina, testifies that South Carolina is taxed as much as it should be in proportion to its income, but the taxation does not yield enough to support the schools in a proper way. In the towns and cities both the white and colored children are fairly provided with houses and school appliances, but in the country districts the school system is more or less of a makeshift, especially so far as the negro children are concerned. No complaint can be made against South Carolina so far as appropriating money for negro education is concerned. About one-ninth of the taxes of the State are paid by the negro race, and that race is largely in the majority in the State. For all State purposes outside of education there is a levy of 5 mills, and for educational purposes there is a levy of 3 mills and a poll tax of \$1 for each adult male below 50 years of age, so that practically half the State taxation of South Carolina goes to the common-school educational system. This school fund is prorated to each school district on the attendance of the previous year. After the prorating is made it becomes a common fund of the district and then the identity as to race is lost, the use of the money depending entirely on the class, ability, and conceptions of the trustees; hence the conditions in one township in the State may be entirely different from those in other townships. In Charleston and two or three other cities there is very little difference in the pay of the negro and white teachers, but in the country districts the negro teachers receive only about one-half the salary of the white teachers. In Charleston all the teachers in the colored schools except 6 are white; in the boys' schools outside of Spartanburg and Greenville both races are employed. If the schools over the State were on the same scale of elevation as in Charleston, no assistance would be needed. (117, 118.)

Mr. Miller testifies that up to 1840, out of a possible school population of 120,000 white children in South Carolina, not over 13,000 attended the free schools. Up to 1860, out of a possible school population of 150,000 whites, not over 30,000 attended the free schools. Prior to 1860 facilities were not offered the poor whites to educate themselves. The schoolhouses were practically all in the towns. The man of property and means in those days educated his children mostly abroad, but the poor man, who had to compete with slave labor, had no opportunity to educate his children at all. The great mass of the negroes were almost wholly ignorant, and had to be kept so if slavery was to exist. The war wiped out the school system of the State, and when it was reorganized there was perhaps greater illiteracy than before the war. Mr. Miller estimates the school population of negroes at the present time at not less than 300,000. (118, 119.)

Mr. SIMPSON says South Carolina appropriates for public schools about \$1,000,000 every year, which is divided per capita between the white and black children; there being a large excess of colored children, that race gets the larger part of the appropriation. He thinks the public schools that are supported by this appropriation are kept open 3 or 4 months in the year. The State is exceedingly poor and is doing the best it can. Almost every community of any importance in the State has a graded school and special taxation to support it. The little which the State pays for higher education is a mere bagatelle, and would not extend the term of the common schools more than a week or two if devoted to that purpose. The school term ought to last 8 or 9 months; the 3 months' schooling is a mere smattering and not real education. The universal demand is for a longer school year. The system does not extend far enough and the money is lacking to establish high schools. In most of the towns, and in some of the country districts, a special tax is levied for higher education, but the people are too poor in many of the other places to pay such a tax. Of all the expenditures of the State, more than one-half, and perhaps three-fourths, goes to the public schools. The public-school system is being improved and is working out good results. (103, 104, 105.)

3. *Georgia*.—Professor DU BOIS, of Atlanta University, testifies that the money for the public schools in Georgia is raised by local taxation, a poll tax, and a number of special taxes, such as the taxes on liquor licenses, half of the rental from the Western and Atlantic Railroad, which is owned by the State, and the inspection tax on fertilizers. The fund is divided among the counties in accordance with the amount of direct taxation which they pay. Very little local taxation is added except in the cities. The schools are controlled locally by a county school commissioner. There are also county boards of trustees and local trustees. The power over education is in the hands of the local elective board. Sometimes there are colored representatives on the board and sometimes not.

Professor Du Bois doubts whether there has been any improvement during the last decade in the condition and standing of the white public schools in Georgia, but he says they are better than the negro schools. They do not compare at all with the public schools of New England. Among the wealthy white people there are a number of private schools. The girls go to women's colleges and the boys to the denominational schools and the State university. Some of them go North for their education.

There is always difficulty about county superintendents because of the small pay they receive, and this sometimes results in hiring teachers who will contribute part of their salaries either to the superintendents or to someone else in order to get places, with the result that a poor class of teachers is often employed. (161, 173, 174.)

Dougherty County.—Professor Du Bois testifies that in Dougherty County about 73 per cent of all persons 10 years of age and over are illiterate—that is, they either can not read or write or can read so little as to amount to nothing. The percentage of illiterates under the age of 20 is about 60 per cent. This increased literacy between the ages of 10 and 20 is attributed to the common schools of Dougherty County, which, although very poor, have some good features. There is no schoolhouse in the whole county that can compare with the very worst schoolhouse in New England. The best one that Professor Du Bois ever saw in the county was a board house equipped with rude benches, without desks, no sort of furniture except a blackboard and three boards put together for the teacher's desk, and only a hole in the side of the wall for a window. Most of the schoolhouses were either old log huts or negro churches.

There is less illiteracy in the town of Albany, the county seat of the county, than in the country districts. There are some good teachers in Albany. The American Missionary Association started an academy there some 20 years ago, and its influence has been beneficial. It is now entirely under colored teachers, nearly all of whom are college graduates. The attendance amounts to 200 or 300. The public school is not quite so good, and the teachers are not paid so well as in the academy. (161, 172, 173.)

4. *Texas*.—Bishop GRANT says that the conditions in all the Southern States where slavery formerly existed are practically the same, but the educational facilities of Texas are perhaps better than in any other of the Southern States, the school fund being larger. (144, 145.)

5. *Deficiencies of Southern education*.—Dr. DABNEY thinks that the South has at last come to recognize the deficiencies of her educational system and the one-sidedness of her schools. The recent agitation for technical education grows out of the desire of the people to work up their own resources. Dr. Dabney fears, however, that there is danger of taking too narrow a view of the subject, and thinks that more attention should be paid to the common school system than heretofore. One of the difficulties with the system of education in the South has been that most of the thought has

been given to higher education and too little to the education of all the people in the common schools. The institutions of higher education in the South are not attended as largely as those of other States, because the Southern States have too few public schools to support them. Another fault with the education of to-day is that the graduates are not fitted for the actual business affairs of life. So long as the graduates are fit for nothing but bookkeeping, typewriting, and newspaper reporting, and are positively disqualified for business or manufacturing, there is something wrong in the system. The common school education should lay a foundation upon which one could build any ordinary profession. It should give a broad basis to make an intelligent artisan as well as a bookkeeper. Technical education is important, but universal public education is more important. Manual training and scientific branches should be put into high schools, where the children can have an opportunity for broad training. If greater productivity is the aim, there must be better common schools. (192, 193.)

6. *Dislike of public schools.*—Professor DU BOIS, of Atlanta University, thinks there is a dislike of the public school system among the best people of the South. They do not think the poor whites ought not to be educated, but they have their doubts as to whether the public school system is the best method of giving the child an education. (173, 174.)

7. *Compulsory education.*—Mr. WINSTON favors compulsory education in North Carolina. It would be the greatest lever in the improvement of the South. It will render the poorer class of people discontented with their present lot, and thereby spur them to renewed endeavors for material improvement, and will increase wants and desires, and thus stimulate their intellectual activities and make them capable of doing more and better things. As an economical measure compulsory education, and also as much industrial and technical education as possible, are desirable. Drawing, designing, carpentering, etc., should be put into the public school system. (127.)

Mr. HARRISON favors compulsory education up to the point of requiring a child to read and write, but no further. (116.)

Mr. SIMPSON says he does not think the educational system of South Carolina has reached such a state of perfection as would warrant a compulsory school law. Such a law might be enacted to apply to the towns and not to the rural districts, but it would be a special law, and Mr. Simpson doubts if it would be constitutional. The schools are so located that it would be inconvenient for a great many children in the country to attend them, and it would be a terrible hardship to require them to go to school unless the districts were so divided up that the schools would be convenient. (106.)

C. Secondary and higher education. (See also, as to conditions in the South, section B.)—1. *High schools.*—Dr. HARRIS calls attention to a significant increase of high schools in the United States, from 2,526 9 years ago to 5,315 at the present time. Natural philosophy and chemistry form a large part of the secondary course of study. Natural philosophy enables the pupil to understand the nature of force and the construction of machines which turn force to useful purposes. (16.)

2. *Colleges.*—Dr. HARRIS testifies that in the 25 years between 1872 and 1897 the number of students in the colleges alone, omitting professional and technical students, increased from 580 in 1,000,000 to 1,201 in 1,000,000, and the number of college students pursuing special investigations increased 25 fold. A table is submitted showing the increase from year to year. (40, 41.)

3. *Higher education of women.*—Dr. HARRIS testifies that the education of women in institutions of higher learning has been revolutionized in the last 25 years. A table is submitted showing the women students in colleges and seminaries for the years 1874 to 1899, which shows an increase of from 14,768 to 37,505. The higher education of women has tended to displace men in certain employments. Women are taking up their quota of clerkships, and out of 403,333 teachers in the public schools only 32.6 per cent are males. (45, 46.)

4. *Scientific and technical education.*—Dr. DABNEY says the old-time college was unsurpassed in giving men character and classical culture, but deficient in that it did not qualify all its students for all the work of life. The great defect was that it had no training for young men who had no taste for the classics, literature, or philosophy, and were not fitted for the higher walks of professional life. About 1870 the necessity for reform in the system of education became manifest to scholars all over the world. The movement for scientific and technical education was world-wide, and the changes made in college education in the South were in harmony with the trend of modern thought and industrial development the world over. It was an auspicious time for such a change in the South, following so closely upon the end of the civil war. The South commenced to appreciate about that time the almost boundless material resources which she possesses, and set bravely to work to build up her waste places and win back the wealth of which she had been deprived by the war. In

order to utilize the resources of the South it became necessary to give Southern boys an opportunity to secure a scientific and technical education. As a result of all these considerations there has been a wonderful development in scientific and technical education in the South. (197.)

D. Proposed Federal aid.—1. *For common schools.*—Mr. MILLER says that on account of the impoverished condition of South Carolina, and because of the great number of ignorant citizens, it is impossible to give them any sort of an education with the money available. He argues strongly for Federal aid for the public schools, and refers to the efforts of Senator Blair in the Fifty-first Congress to that end. Better citizenship will benefit the General Government, and if the State is too poor to furnish the means for education it then becomes the duty of the Federal Government to give its assistance. While there is no precedent for such aid, there is no other case in which such justifiable demands for making a precedent exist. It is the duty of the Government, whenever the people are impoverished and unable to enlighten themselves, to furnish the means to educate them, and if the Federal Government lends its assistance in this case the South will not only be in a condition to help itself in a short time, but will also be of general assistance to the entire country. (118-120.)

Professor Du Bois thinks the National Government ought to do something for common school education in the South, especially for negroes, and he recommends a bill modeled on the Blair bill. He suggests that an appropriation ought to be made in proportion to illiteracy in the various States, the National Government merely supplementing local efforts. He would make the law equally applicable to all, so that some white schools would get the benefit of the Government's aid. (174, 175.)

Professor WAGNER believes that the National Government should come to the aid of the Southern States in helping to educate the illiterate, especially the negroes. He believes that all the Southern States are expending and have expended as much money in aid of education as they can afford. The sentiment of the Southern States is largely in favor of a measure on the lines of the Blair bill. In the State of Georgia he does not think there are over one dozen schoolhouses for colored people, in the country, especially, that were built for school purposes. (203, 206, 207, 210.)

Mr. WINSTON favors an appropriation from the General Government in aid of textile and manual schools, and also in aid of the common schools of his State. He was in sympathy with the Blair bill. The public schools have not been developed in the South to the point of efficiency, and are not ardently supported either by the educated or by the uneducated people. Agitation has gradually pushed them forward, though somewhat slowly. His reasons for asking Federal aid are two: (1) Because of the unusual impoverishment of the South by the war, and the burdens resulting therefrom; and (2) because it would result in the improvement of citizenship. There is no reason in the nature of things why education should be any more a State function than a national function. There should be a national university, for instance, at Washington, and there should be some system arranged whereby the United States would help the weaker section or States in pulling up to the general national level of education, just as the State is now helping the weaker counties to pull up to the general level. National aid might be given in the form of subsidies to normal schools for technical and industrial education. The supply of education for the professions other than teaching is already ample. (126, 127.)

Bishop DERRICK says it is a hopeful sign that those who some years ago opposed negro education now favor it. He thinks the South would be very much better off if the nation would adopt ex-Senator Blair's bill, or some like measure. The South has done remarkably well since the war in the matter of negro education, but her resources are not sufficient for this purpose. If Congress would pass a national educational bill, appropriating money for educational interests, and the negro should receive his share, it would be very much better for everybody concerned. In the Southern States there are only from 3 to 6 months' schooling in a year. (157, 158.)

Mr. SALTER desires legislation providing for national aid to the South for educational purposes, especially for higher industrial education. (154.)

Mr. SIMPSON says that South Carolina has been as liberal as possible with her limited resources. There is a very good feeling between all the institutions that receive State aid, but all of them need additional aid, which must come either from private donation or from the Federal Government. A great deal of money is needed for Clemson College; its capacity ought to be doubled, and the textile department is going to be costly. (102, 104, 106, 107.)

2. *For industrial education.*—Mr. BEATY thinks the United States Government ought to recognize it as a duty to establish and maintain manual and textile schools, especially in the States of the South, where there is a large ignorant population, and where the means or facilities for education are meager. There ought to be one

advanced textile school in each State, and several other such schools of a lower grade. (99.)

Mr. HARRISON thinks the United States Government could very profitably give a liberal support to Clemson College or to any other school of a like character. He believes that all American products should be manufactured in this country, and that if the technical schools were accorded sufficient support they would be of great benefit to the entire country. It would pay the United States to put money enough into these technical schools, with proper safeguards, to make them first-class institutions, where every boy, whether rich or poor, could get the education he desired. South Carolina is appropriating as much money as she can afford for educational purposes. Common schools are more in need of funds than any other institutions. In the rural communities the neglect in education is not caused by the lack of appreciation of the need of it, but by the depression which has existed in the South for a good many years. The raw material produced in the South has been worth, until recently, little above the cost of production, with the result that the people have been reduced to very great straits. (109.)

Mr. MILLER argues that the Federal Government should come to the aid of the manual training schools of the South. In the cotton factories there is needed a supply of skilled operatives, and the Government ought to assist in educating the young men, so as to enable that section of the country to compete with other markets.

Every additional wheel in the way of manufacturing that is started up or caused to turn enhances the wealth of the Government; but if these wheels are started in incompetent hands the thing collapses and the Government in the end is the sufferer.

The United States Government ought to turn over to the States the fund now in the Treasury due to dead negro soldiers, whose identity has never been established, and never will be established, for the establishment and equipping of textile training schools. That fund is quite large, and it should be prorated among the States in proportion to the number of soldiers from each State who have not been identified. (120, 121.)

III. TECHNICAL AND INDUSTRIAL EDUCATION.

A. General discussion.—1. *Desirability.*—Mr. WINTER, a journalist, of Boston, Mass., believes in applying technical education to every pursuit. He believes the United States Government should assume the responsibility of such education. The United States is taking on the character of a world empire. It is assuming new responsibilities, and the standard of education needs to be changed to meet the changed conditions. Up to the beginning of the nineteenth century education was practically in the hands of the theologians and philosophers. Technology developed first among the professions of law, theology, and medicine, and it is only within the last 50 years that it has reached commerce and the trades. Napoleon was the first to appreciate the idea of national responsibility for technical education. The University of Paris, France, has a laboratory attached to every professor's chair.

The United States Government should establish a university at Washington. There is at present in the United States no national recognition of any educational responsibility except in the case of the Indian. Technical education succeeds in Europe because the Government furnishes it. The United States Government, especially for the consular service, needs a technical school, which no one but the Government can furnish. It would be better to bring the technically educated European professors to this country than to send the American boy abroad to secure a technical education, often at the expense of patriotism. (66, 67.)

Mr. Winter says that New England is being educated by 11,000 women teachers, who can not and should not be held responsible for technical education. What is true of New England is true of every other section of the United States. The native New Englander is becoming a wealth distributor instead of a wealth creator, because of a lack of technical education, and is being supplanted by the thrifty foreigner. "New England is already the producer of industrial ruins. Her textile supremacy has departed." (67, 68.)

Mr. BRATY, quoting from Mr. A. F. Barker, headmaster of the textile department of the Bradford (England) Technical College, says the three stages of education are, first, the home life; second, the school and college life; and third, the communal life. The home, school, and college life do but prepare for the practical everyday life of the world, which is really the training college of life. The great work for industrial education is the raising of industries into practical sciences, which shall call forth the energies and capabilities of the best of our industrial population. The value of industrial education as a direct preparation for earning one's daily bread must not be overlooked. The first principles of technical training are system, accuracy, and fairness. In the case of a mechanical student, he is taught to use the

proper tools or machine for each kind of work, and is also taught the theory of engineering of the kind he may be studying, together with the fundamental principles of the machines used. The technically trained man is enabled to differentiate between the important and the unimportant, and to understand new machines that may come under his attention. He thus has an immense advantage over the man not so thoroughly equipped. Industrial schools develop the scientific side of the trade or business with which they are connected, and are the workman's best friend. Many of those who are now filling good positions as railroad engineers, bridge constructors, shipbuilders, etc., would probably be laborers at small wages if it were not for the industrial education they have received. Many of the graduates of Clemson College, South Carolina, for example, are now occupying positions of responsibility and commanding high salaries, not because they are more brainy than others around them, but because they have had that technical training which has fitted them for such positions. (96, 97.)

Mr. HARRISON thinks it would not be good policy to inaugurate a system of technical training in the common schools, because if special lines were begun and followed out prior to the time the pupil reaches 15 or 16 years of age he would be obliged to leave off the general studies, which are really necessary as a foundation for all education. The special courses, in his opinion, ought to be taken up after the pupil leaves the common schools. (111.)

Dr. HARRIS maintains that while general education is perhaps sufficient for the masses of the people, there should be enough industrial schools to enable any person in the community to learn all that a school can teach regarding the main industry of his community.

Dr. Harris does not think the apprentice system best for learning a trade. In many of the arts the school gives a better instruction. The complaint against the apprentice system is that the employer naturally wishes to get as much as he can out of the apprentice, and keep him as long as he can in his service, and he therefore holds back from the pupil a knowledge of the higher secrets of the trade. Often the apprentice is not helped at all to acquire the highest skill. In a school the idea is entirely different, and the pupils are taught as rapidly as their capacity will permit. Between 1870 and 1890 the classes of labor which require more directive power and more skill increased very much faster than the population. Draftsmen and inventors increased fourfold; chemists and metallurgists increased threefold; journalists doubled; printers, compositors, and lithographers nearly doubled, while the men of all work decreased greatly, and the specialized workers in iron and steel increased from 14 in a thousand to 21 in a thousand. Many other skilled trades practically doubled their numbers. (40.)

Dr. Harris says that there has been great activity in the adoption of new industries in the United States, especially since the Centennial Exposition at Philadelphia. Russia, in her exhibit at that exposition, showed what could be done in the way of reducing the elements of trades to a teachable form. It is much less expensive both for the teacher and the learner to have the elements of industries taught in progressive lessons to classes than by the so-called apprentice system. After the Crimean war the Russian Government became aware that there were more people producing raw material in that country, especially in the form of agricultural products, in proportion to the population, and a smaller ratio engaged in manufacturing and commerce, than in any other country in Europe; and the nation introduced skilled workmen into the villages and cities of Russia from the west of Europe, together with school shops for the training of skilled labor, with the result that Russia has increased very materially her annual product. A nation that depends entirely upon agriculture, even if it is a fertile country, will not be a wealthy country. (8, 9.)

2. *Advantages shown by German experience.*—Mr. WINTER says that the German Government has done more in the way of applying technical education to every pursuit than any other nation in the world. It is admitted in Great Britain to-day that that country is in danger of being supplanted by Germany on account of her devotion to technical education. In the German army a man is trained in everything, even down to shoeing a horse. "They take a man and make the most of him." That is the German idea of the "fatherland." Germans who come to this country are above the average immigrants. They are well educated and carefully trained. Their superiority is wholly attributable to the superior education given them by the State. The United States has much to learn from Europe in this particular. Germany believes that the world's industrial supremacy is within her grasp. She does not rely upon an abstract theory of protection or free trade, but educates her citizens in commercial supremacy. (66, 67, 68.)

Mr. BEATY, professor in Clemson College, South Carolina, says the Germans are probably the most progressive and practical nation of the world, and have brought about some wonderful results by working the theorist and the practical man side by

side. Germany, with her great population and insufficient land, has to import raw materials, including about 1,000,000 tons of coal per year, besides quantities of food stuffs to sustain her people. Yet laboring under these great disadvantages she stands second in the list of nations of the world in trade, largely by reason of the fact of her industrial education. Any industry will seek that nation which has the special knowledge best suited to it. A celebrated German chemist, Hermendorf, was the first to discover the process to make an absolute fast black. The Germans have also shown us how to increase the value of raw materials by increasing and utilizing their by-products. For instance, they increase the value of coal tar by manufacturing phenacetin, thereby multiplying the value of the raw materials some ten thousand times. In almost every town of this country various articles of manufacture are found stamped "Made in Germany." The demand for these articles shows their superiority. What Germany has done America can do, because the American nation is equally energetic and her natural resources are much greater. (95, 97, 98.)

Dr. HARRIS says that Germany is the most remarkable example to be found of a sudden increase in production. In 1870 Germany produced about 26 cents per day for each inhabitant. By diversifying the industries and raising at home what had formerly been purchased abroad, the productive power per capita has increased about 10 cents a day in the last 30 years. One of the chief industries is the production of sugar from beets. Germany ascertained that she was using much less sugar per inhabitant than many other countries, although being a northern country her inhabitants needed the carbon which sugar contains. She thereupon began to raise beets, improving the method of culture, and to manufacture her own sugar, with the result that there has been a revolution in the production of sugar. Formerly sugar cane furnished nearly all the sugar; now the annual product of cane sugar is 4,500,000 tons, while the beet sugar of the world amounts to 5,500,000 tons. (13.)

3. *Nature of instruction.*—Dr. DABNEY says a complete system of technical schools comprehends the following:

1. A system of trade-schools, in which pupils are trained for the leading arts.
2. Polytechnic schools, in which instruction in the applied sciences and technical or professional training are offered more advanced students.
3. Institutes of technology or departments of science in universities, in which the highest professional instruction in the applied sciences is provided. (195.)

4. *Existing industrial and manual-training schools.*—Dr. HARRIS testifies that manual training has been introduced to some extent into our public schools, and quite a number of remarkable schools have been founded in different parts of the country to teach industries. These special schools are taking the place of the shiftless methods of apprenticeship. The school differs from apprenticeship by laying a solid basis in science and arithmetic. It enables the pupil to understand the machine and to invent a better one if needed. There are at present 125 industrial schools in the country, whereas 10 years ago there were only 18. The witness submits a table showing the number of cities of 8,000 population and over in each State in which manual training was given in the public schools for the years 1890, 1894, 1896, and 1899. Manual training was recommended for the students of the University of Virginia by Thomas Jefferson, and Benjamin Franklin included it in his plan for an academy at Philadelphia. About 1830 the idea was actively put forth, but it was not until after the Centennial Exposition in 1876 that the present system of manual training was put into effect in this country. Strong opposition was made among school men for a time, but manual training has steadily grown in popularity and a constantly improved method has resulted. In 1899 manual training was an essential feature in the public-school course of 170 cities. In 350 institutions other than city schools there is training which partakes more or less of the nature of manual training. These institutions embrace almost every class known to American education, and the manual features vary from the purely educational manual training to the direct trade instruction of the apprentice schools. In many cases the legislatures have taken cognizance of the movement. Massachusetts requires every city of 200,000 inhabitants to maintain high-school manual-training courses approved by the State board of education. Maine authorizes any city or town to provide instruction in industrial or mechanical drawing to pupils over 15 years of age. Industrial training is authorized by general laws in Connecticut, Georgia, Indiana, New Jersey, New York, Utah, Wisconsin, Wyoming, and the District of Columbia. Detailed tables are submitted by the witness showing the cities in which manual training other than drawing was given in the public schools in 1898-99, and describing the courses. More than 40 of the 101 manual-training schools in the United States mentioned in the table referred to are of high-school grade. (16-33.)

Dr. Harris says the manual-training school as it exists to-day is in an experimental stage. It is important, but it has not solved all the problems, nor has it shown that the French and Belgian systems of special industrial schools is not preferable. The

most obvious reason in behalf of the manual-training school is that this is an age of machinery, and it is well to have each individual know something about all the industries in which machinery is used. (51.)

Mr. THOMAS E. MILLER thinks manual training should not be established in the public schools in the country, but that every city graded school, both white and black, should have a manual training department, if possible. (118.)

Professor ROBERTS, of Cornell University, says manual training should be begun in the public schools as soon as the child shows constructive instincts. A student trained to use his hands will acquire the higher education far more rapidly than one not so trained, and the higher education will be of far more value to him if he can sympathize with and appreciate manual workers. Professor Roberts would not make manual training a hard and fast system, but would give opportunity for originality. (225.)

5. *Need of teachers.*—Dr. HARRIS says the importance of good teachers in the teaching of industries can not be overestimated. At present there are few teachers who can teach the arts and trades as well as the great mass of teachers can teach the ordinary English branches. (40.)

B. Conditions and needs in the South.—(See also *Education of the Negro*, p. LX).—Dr. DABNEY, president of the University of Tennessee, says that the most interesting fact in the recent history of the South is the rapid development of schools of science and technology. The report of the United States Bureau of Education for 1898-99 shows that out of 152 colleges and universities of a general character in the South, including Maryland and Missouri, 16 have extensive technical departments. In addition to this, counting those for colored students, there are 28 agricultural and mechanical colleges; 3 State schools of technology or mining, separate from these colleges; 6 local technical schools, and 3 separate military academies—making a total of 192 schools in those States giving instruction in science or technology. None of these except the military schools existed prior to 1865. The Virginia Polytechnic Institute, the Miller Manual Training School of Albermarle, the engineering department of the University of Tennessee, and the Georgia School of Technology are splendid representatives of this class of institutions. (197.)

There is no difficulty, says the witness, in accounting for the early indifference of the Southern people to science and technology. A young people always view their raw material as their chief source of wealth. When they become older they discover that it is not upon natural wealth alone, but upon the culture of the scientific intellect that permanent prosperity depends. The acquisition of wealth must precede the cultivation of science. Technical skill is needed to utilize the raw material to the best advantage, and in the history of every nation the time comes when it must educate its people in science and train them in manufactures and industry. The higher scientific education is the forerunner of higher prosperity, and the nation which fails to develop the intellectual faculty for production must degenerate. (195, 196.)

Mr. RICHARD W. SIMPSON, president of the board of trustees of Clemson College, South Carolina, testifies that before the war labor was not considered respectable in South Carolina, inasmuch as it was associated with slavery. A young man would not go into a business of any kind in which labor was required. That false pride continued until long after the war. One of the principal objects sought to be accomplished by a system of industrial education in South Carolina was to break down this prejudice and make labor respectable and profitable. That was the object in mind in establishing Clemson College. (101.)

Mr. Simpson regards manual and textile education as of the greatest necessity for the Southern people. They particularly need it because they have never had anything of the kind. The opportunities for the development of manufacturing resources are untold. What is needed in South Carolina to meet the necessities is high schools, which are a link between the colleges and the common schools. The boys in the country have no facilities but the common school, and can not step from there into the college. If the State could receive assistance in supplying all the demands of the people for technical education there would be a great demand for the necessary steps to reach that point. There is a strong movement throughout the State to establish technical teaching in connection with the free schools, and in some schools it has been already organized. One school in Charleston has mechanical training and one at Beach Island. Dr. Curry, head of the Peabody Institute, recently made a speech before the legislature of the State, in which he very strongly advocated the addition of technical training to the public-school system. (104, 105, 107.)

Mr. HARRISON says there is abundant opportunity for higher literary education in South Carolina, but there is not an abundance of technical, manual, or industrial educational facilities. The common schools, in his opinion, ought to be graded up to the point where every pupil could receive an ordinary English education that

would fit him for the transactions of ordinary business. After that the student should have the privilege of going to a technical, manual, or literary institution as his inclination dictates. (109.)

Mr. BEATY says that the principal reason why the South has not increased in wealth in proportion to other sections of the country is that she has not taken advantage of her natural resources, and has not manufactured her raw materials. There has been a wonderful development of her industries recently, much to the betterment of this section. In order to continue this progressive movement the South must have men of original ideas and scientific education. There are many young men capable of being employed in the mills who are anxious to learn the business, and if they are instructed in the practical operations of machinery and receive an auxiliary technical training in the other details of manufacturing they will become proficient. A mill is the best equipped textile school for advanced practical instruction, and the best instructors are the competent managers. A young man in a mill to-day very often has not had that previous technical foundation upon which to specialize in his industry, and an absolute necessity has thus arisen for the establishment of such schools as will give special training in these industrial lines. The average cotton crop of America is 10,000,000 bales. If the South should produce a number of men and women sufficient to turn this vast crop of raw material into cloth, supposing the average price of the cloth to be three times the value of the raw material, it would bring in a yearly revenue of \$850,000,000 more than the raw material. The American factories are now utilizing only about 30 per cent of the American cotton crop, and the foreign countries are reaping the benefit of manufacturing nearly 70 per cent. A change in this regard can not be brought about except by textile education. (97, 98.)

C. Clemson College, South Carolina.—1. *General description.*—Mr. SIMPSON, president of the board of trustees, testifies that Clemson College was originally started as an agricultural college, but has since developed into an industrial school. It is not a manual training school, and does not teach the students to become mechanics or machinists, but is trying to broaden their intellects and teach them the fundamental principles and practice in all different departments of work. The witness does not believe that the old system of education would bring about such natural development as the system in vogue at Clemson College. Even in the freshman year the student is taught drawing or designing. The result is that his faculties of observation and accuracy, which are the most powerful agencies for education, are early developed and improved. In the old times the Southern people took life easy and never thought of being exact or accurate in anything. When the boys enter the wood shop in the school their first efforts are very crude—they have no conception of accuracy at all, but when they have gone on into the machine shop their accuracy is graded to the 0.003 part of an inch.

Clemson College has a wood shop, blacksmith shop, foundry, machine shop, electrical and mechanical laboratories; it has designers, free-hand instructors, and teachers of physics in the mechanical department of this school. There is a professor of agriculture, and under him instructors in horticulture, botany, veterinary science, entomology, and two or three other branches; the students are taught not only the theory, but the practice. In connection with that department is the experiment station, in which experiments are conducted under the eyes and observation of the students, with very beneficial results. There is also a chemical and scientific department connected with the school. This embraces chemistry, geology, and mineralogy. A textile department has recently been added also.

The school has been successful far beyond the expectations of its most sanguine advocates. It has turned away this year as many pupils as it was able to take care of, and enough written applications have been received for the next year to fill the college anew. The results of the education received there are shown by the fact that the graduates are in great demand, and step from the college into salaries ranging from \$600 to \$1,500.

The great difficulty met with in the establishment of Clemson College was to educate the people to its importance and necessity. They had never seen anything like it before, and many schools of a somewhat similar character, where literary and technical education was combined, had proven very costly and had not been successful. (101, 102.)

Mr. Simpson thinks that if the technical education which is carried on at Clemson College should be sufficiently extended to meet the wants and demands of the people there would be such a demonstration of its value that all would seek it. Three-fourths of all the pupils at Clemson College are poor boys from the country, who can not get an education anywhere else in the world. Many of them are working their way through college, and if the college had the means to help the poor boys

it could double its capacity and be filled with boys from the ignorant class of people. (106.)

Mr. BEATY says that the training in Clemson is very thorough. Her graduates are very successful and are now filling positions of importance in various lines. Owing to the Spanish-American war a large proportion of the class of 1898 went into the Navy several months before they had completed their course of study. Several members of this class are now working with shipbuilders, railroad companies, bridge constructors, and builders of electric railroads. A graduate of this school is now in charge of a large electric power plant. Within 6 weeks after graduation the entire class of 1899 had received profitable employment, one of them, within 3 weeks, having been placed in control of a Government electric plant at a salary of \$1,200 per year. Many of the students are farmers' sons and have not had the advantages of a common school education, so that their development has been brought about by the college. (92, 98, 99, 100.)

Professor Beaty says that Clemson College has graduated 72 students. The total enrollment for the year 1900 is 435. With a larger endowment or income it could greatly increase the work. The students are all male whites. The average cost per student per year is \$99, including board, lights, fuel, laundry, uniform, and cap. This does not include shoes, books, or underclothing. The regular tuition fee is \$40. This sum is a part of the income of the college in addition to the \$71,000 from the several funds. (92, 99, 100.)

Mr. HARRISON agrees with Professor Beaty that the pupil should learn by theory as well as by practice. He knows of a good many young men who have gone into manufacturing in different departments who are lacking in that broad culture which the technical schools can give. He is not altogether in sympathy with the policy pursued at Clemson College, because he thinks too much attention has been given to the literary department there instead of to the technical department. Within the last two years, however, he believes more attention has been given to the technical work. (109.)

2. *Finances.*—Mr. BEATY testifies that Clemson College was established in 1893. It does not receive any direct appropriation from the State, but is allowed the "inspection tax" of 25 cents per ton on all fertilizers manufactured in the State, which amounts to from \$40,000 to \$65,000 a year. From the Federal Government it receives its proportion of the Morrill fund, amounting to \$12,500, and from the scrip fund about \$5,000 per year. The annual support of the college from all the funds is usually a little over \$71,000 a year. (92, 99, 100.)

Mr. SIMMONS says that South Carolina has provided another college, similar to Clemson College, for the negro. The old South Carolina College and the Citadel Academy, both of which are located at Charleston, are maintained by the State. There are no colored students at Clemson College. In the early days Congress gave the States land scrip for educational purposes. During the period of reconstruction the fund of South Carolina from this source was stolen, and the State replaced it by bonds, which are still outstanding. The fund raised from these bonds is equally divided between Clemson College and the colored school referred to. The Morrill fund is equally divided also, but the Hatch fund is not. The authorities that manage and control the Hatch fund are opposed to the establishment of branch institutions. The State has given Clemson College from \$300,000 to \$400,000 to erect and equip it, and the college gets a surplus of the proceeds of the tax on fertilizers, which amounts on an average to \$50,000 a year. The State has also established an industrial school for women, and has spent a great deal of money in building houses and schools and equipping them. (103, 104.)

3. *Departments.*—Mr. BEATY says Clemson College is divided into three separate departments—namely, agricultural, mechanical, and textile. The agricultural department employs 6 instructors and has 45 students; the mechanical department employs 7 instructors and has 88 students; the textile department employs 4 instructors and has 48 students. Freshman and preparatory classes are not included. About 15 other instructors are in the academic work of the college. The average salary of instructors is \$1,208; the average working time for each instructor, class-room work only, is 28½ hours per week. The students have 30 hours of work a week—15 hours of class-room work and 15 hours of practical work. The regular students all pursue the same studies in the freshman year. At the beginning of the sophomore year each student elects which of the 3 courses he will pursue. (92.)

4. *Mechanical department.*—Mr. BEATY says the mechanical department of Clemson College has been in operation since the founding of the college. In the third year the electrical and civil-engineering courses branch out from the mechanical-engineering course. The building set apart for the work of this department contains about 30,000 square feet of floor space, and has the divisions of woodwork, forge, foundry

work, machine shop, drawing rooms, and mechanical laboratory. In the theoretical work of the freshman year the time is devoted exclusively to mathematics, English, history, and such like culture studies. In the sophomore year the studies bear either directly or indirectly on engineering. In the junior and senior years the student specializes entirely in the division which he has elected. Practical woodwork, forge, and foundry work begin in the freshman year. The class in foundry work cast several times a week and make all of the iron and brass castings used by the different students in the construction of engines, dynamos, motors, etc. Work in the machine shop is taken up in the junior and senior years. Exercise work is given out first to familiarize the student with the different machines employed. In a short time they begin to finish the castings sent in from the foundry. Following this comes the instruction in the building of small engines and the winding and finishing of dynamos and motors. The mechanical laboratory is equipped with air compressors, water motors, electric motors, and everything of the kind, and ample facilities are afforded the student for detailed study of the various machines that must be used by him in the practice of his profession. In addition to this a series of lectures on patent law and the laws of contract and specification are given the student. The object of this mechanical course is to give a young man as broad an engineering education as 4 years of systematic technical training will permit. (93.)

5. *Electrical engineering.*—Mr. BEATY says that the work of the electric-engineering department is carried on by lectures in the class room and individual instruction in the laboratory. The laboratory is handsomely equipped with expensive instruments. The dynamo laboratory contains all kinds of electrical machines likely to be found in a modern electrical plant. The students operate these machines as they would be operated for practical purposes. The efficiency of each machine is tested and results are noted. They also test for practical errors in dynamos and motors, the machines having been deranged by the instructors. Fully one-half of the motors used in the various departments of the college were built in this laboratory. The aim of the instruction given in this course is to equip the students fully in the essential principles of the profession, as well as to give them practical knowledge of the construction and operation of dynamo-electrical machinery. (93, 94.)

6. *Civil engineering.*—Mr. BEATY says that the course in civil engineering at Clemson College begins with plain surveying in the sophomore year and includes the general principles and operations of surveying with compass, level, and transit. The object is to make practical surveyors. The field work includes surveys of large tracts of land, of which the areas are computed and accurate plats drawn. Lands are divided out and irregular and intricate boundary lines located. During the junior year classes are employed in the study of the higher forms of surveying, highway engineering, the theory of railway construction, etc. Advantages of various materials for road coverings, and the effects of grades and surveys upon the cost of transportation, and the computations of earth work are studied. (94.)

7. *Textile department.*—Mr. BEATY says that the trustees of Clemson College appropriated \$15,000 to establish a textile school, which has been in operation since November, 1898. The building and equipments cost about \$30,000, about \$12,000 of which was donated in machinery by various machine builders. In the sophomore year the student is allowed to specialize to a limited extent. Special lines are not followed very closely until the third year for two reasons: First, the student ought to get a good general education and familiarize himself with certain branches of mechanics and science, and, second, any narrowness of education ought to be avoided. The first and second years of the course are devoted to mathematics, English, history, natural philosophy, theoretical chemistry, woodwork, forge and foundry work, descriptive geometry, free-hand and mechanical drawing. The third and fourth years of the course are devoted to the study of textiles, with a continuation of chemistry, higher mathematics, the steam engine, mechanics, mill construction, fire protection, and machine-shop work. The study of textiles includes carding, spinning, weaving, designing, and dyeing. A special study of the machines is also made, and the students are required to tear down, rebuild and adjust the machines, and to operate them. The first instruction in weaving is given on handlooms of special construction, the power loom operating too rapidly to permit a student to understand all the motions of it. On the power looms the student designs, under instruction, the fabric he is to weave. He makes his calculation as to the counts of the yarn, the number of ends, and the colors to produce it. He makes up his warp and arranges his loom, setting and adjusting until the machine is working properly. The students are taught how to take advantage of power so as to economize it. Preparation is being made to give full instruction in Jacquard weaving and card cutting. In dyeing the idea is to teach it as a science and not as an art. Colors are produced by combining some or all of the prismatic colors in various proportions. As far as

practicable the student is instructed in mill architecture and fire protection. The commercial features of the mill are discussed to a limited extent, and a series of talks are given on the more important commercial cottons of the world. The student is taught how to choose cottons so as to produce a given quality of yarns. (94-96.)

Mr. SIMPSON testifies that the textile school at Clemson College was made possible by the generosity of manufacturers all over the country in donating machinery, outfit, and equipment. Technical training is very costly and requires trained men, who are very scarce. "We do not propose just to teach the boys how to spin and weave." The witness does not think it possible, under our form of government, thus to tax the many for the benefit of the few. The people can be taxed for the benefit of the whole, and incidentally an individual may be benefited. If the college were to stop in the textile school with the idea of simply making weavers, spinners, etc., it would be wrong, because the boy could go to the mill and get practical knowledge quicker. The object of the school is to turn out educated men who will go into the factories and become the leaders and form the characters of the people in factory labor. The witness believes the results will be large enough to justify the State in levying a tax for the support of the institution. (107, 108.)

D. North Carolina College of Agriculture and Mechanic Arts.—

1. *General description.*—Mr. WINSTON, president of the North Carolina College of Agriculture and Mechanic Arts, testifies that the scope of that institution is to educate for civil, mechanical, and electrical engineering, and for agricultural and general scientific work. A beginning has been made in textile education, and efforts are being made to put up a textile building, which will be a modern cotton mill equipped with the necessary machinery, that will give practical instruction. The college has been in existence for 10 years, and began on the money received from land scrip donated to the State by the General Government. It amounts at present to \$7,500 a year. The present income of the college is from this land-scrip fund and the Morrill fund, and from a State appropriation of \$10,000 a year, together with fees from the students. The college receives some benefit from the money given to experiment stations by the Hatch Act, under an arrangement by which certain officers of the experiment station receive part of their compensation from the funds of the college and perform certain duties in the college. (125.)

2. *Students.*—Mr. WINSTON says the students are all white males. The rules of the college admit females to the technical course, or, on the special vote of the faculty, to any other course. Females are not encouraged to come without a definite purpose in their coming. They will want to come to the textile school when that is well under way and they will be received there without any limitation at all. The reason for the partial exclusion of females is that the State has provided another institution especially for them. The total enrollment of pupils this year is 293. (125.)

3. *Tuition and expenses.*—Mr. WINSTON says the tuition fee at the North Carolina College of Agricultural and Mechanical Arts is \$20 a year for 9 months; board is \$8 a month; the uniform costs \$16; fuel and lights, \$12 a year. Anyone who comes to the college desiring instruction in machinery only will be received and not compelled to take any instruction in books, but those wanting instruction in books and not in machinery will be refused. (125.)

4. *Course of instruction.*—In the freshman class every student, regardless of what course he is to take subsequently, in addition to his 15 hours a week of book studies, is required to do 12 hours a week of practical work in the carpenter shop, lathe room, and forge shop, including drawing and designing. Higher up in the course the shop work is differentiated. One who is to be a mechanical engineer, for instance, goes into the machine shop; an electrical engineer will spend his time in the machine shop and the electrical shop. One-half the time of the first year is given to actual industrial work, and about three-fifths of the time of the subsequent years. Most excellent results have been obtained, some of the students being called away even as early as the sophomore year for work in architecture and in machine shops. The demand is so great for trained workers that some of the best men are lost annually. If the equipment were ample the college could secure from 1,000 to 2,000 students. (125, 126.)

E. Hampton Normal and Agricultural Institute.—1. *General description.*—Mr. FRISSELL, principal of Hampton Normal and Agricultural Institute at Hampton, Va., says that that school was organized originally by what was known as the American Missionary Association. It was started soon after the war, and General Armstrong, who had been with the colored troops, took charge of it. As the school grew a board of 17 trustees was appointed, and the school was chartered by the State of Virginia as a normal and agricultural institute for training teachers for the public schools, first of the State and then of the South generally, and also to give instruction in the trades.

There are now about 60 buildings at Hampton Institute, with an estimated value of between \$500,000 and \$800,000. There is a very beautiful church, which cost \$50,000 or \$60,000. Instead of being like an ordinary school the institute is more like an industrial village. (77-78, 82.)

2. *Finances.*—Mr. FRISSELL says Hampton Institute receives a third interest of the land-scrip fund of the State of Virginia, a part of the Morrill act fund appropriated to agricultural colleges, \$12,000 a year from what is known as the Slater fund, and \$2,200 from from the Peabody fund. It also has 120 Indians as students, receiving for each \$167 annually appropriated by Congress. The cost of the school is now between \$140,000 and \$150,000 annually. There is an endowment fund of over \$700,000, and about \$80,000 is raised yearly from charitably disposed people, and from churches, Sunday schools, etc., through the North. (78.)

3. *Students and their work.*—Mr. FRISSELL says the day students and boarders at Hampton Institute number about 1,000, of whom about 650 are boarders and the rest day scholars. With the exception of about 120 to 130 Indians they are all colored. Males and females are admitted on an equality. The average age in the boarding department is about 18 years. Students are not admitted until they are able to enter the industrial training schools, the age limit there being 16 years.

The majority of students that come into the boarding department go into the night school, where they study 2 hours a day, while they work 10 hours a day in the various shops. There are 16 shops and a large sawmill, and the students have a chance to work and very largely earn their board and clothes. They are not allowed to spend money, but must lay it aside. The first year is given up very largely to this work. Upon first entering the school they are taken to the laboratory, where they learn something about air, water, and soil. They are introduced to books gradually, and the result is that out of this course of instruction a love for work is developed. They earn about 8 cents an hour for their labor if they are fairly capable.

At the end of the year they can go into the academic department and take up certain studies, history, geography, and the like, but all related definitely to agriculture and trades, and they have also manual training. They begin with the simplest kinds of woodwork and gradually go up through the wood, iron, and tin work. Every girl is taught something of woodwork, and is not allowed to graduate unless she can cook a good meal, make her own dresses and her underwear. There are some students who do not go through the academic department, but go directly into the trades after they have been through the first year of the school.

When one of the undergraduates leaves the school to go into business he is given a statement as to what he has done there, but gets no certificate or diploma until he graduates. The requirements for graduation are arithmetic, a little algebra, and some geometry, a fair knowledge of American history and geography, a knowledge of the Constitution of the United States, and some knowledge of chemistry and physics. The graduates in mechanics could take up a trade, but they probably would not directly become journeymen. (78, 80, 82, 83.)

4. *Graduates.*—Mr. FRISSELL says that of the graduates of Hampton Institute about 90 per cent have gone into teaching, at least for a short time. Hampton has sent out about 1,000 graduates, 150 of whom have died, and 803 of the others are accounted for. Of these, 140 are in various occupations; 227 are teaching; 26 are teaching trades; 60 are teaching and operating farms; 5 are teaching farming and working at trades; 15 are teaching and working at trades, and 31 are engaged in working at other occupations. There are 47 working at trades; 53 in the professions; 15 farmers; 34 students in other schools, and in other occupations, 124.

About three-fifths of the graduates so far have been males. A larger number of the male graduates would become farmers and mechanics if there was not such a great demand for teachers. It has been considered for the best that the graduates should go into the public schools of the South, where they get a salary usually of \$25 a month for from 3 to 5 months of the year, and thus get a little money and build houses and cultivate a little tract of land. They are thus able to present an object lesson to the community. They are the moneyed people among their own race in the communities in which they have gone. Into one county in Virginia some 40 or 50 graduates have gone and started schools and cultivated land, with the result that to-day they pay one-fifth of the property tax of the county. Where there has been such increase of property, there has been a corresponding decrease in crime; and there is no trouble about race problems in that county. Booker T. Washington is one of the graduates, and has made a very great success at Tuskegee, Ala. What has been done at Tuskegee has been done in a smaller way in almost every State in the South. (79, 87.)

5. *Departments and character of work.*—Mr. FRISSELL says that in Hampton Institute there is an academic department in which sufficient knowledge of English, mathematics, etc., is given to enable the students to properly pursue their course in the

trades and in agriculture and other departments. In addition to the academic department, there is the department of agriculture, the department of trades, the department of domestic science, and a normal school, the latter being devoted especially to the furnishing of teachers for the public schools of the South. (78.)

Connected with the academic department there is a manual-training school, and from the time the children commence in the kindergarten until they graduate they are given some sort of manual training. Instruction is on the principle that labor—the habit of work—is the solution of the race problem. Every student has to work. In the day school there are 300 or 400 who come from the community near by, but it is a regular part of the school work connected with the county. The girls commence in cooking and sewing. Emphasis is laid on industrial education, and book learning is subordinated to this idea, because the *doing* is the important thing rather than the knowing. Both should be harnessed together. (79, 80.)

Mr. Frisell says there are post-graduate courses in the academic department for those who are fitting themselves for teachers in any line. There is a domestic science department also, where cooking, sewing, and dressmaking are taught. (81.)

6. *The trade school.*—Mr. FRISSELL says the trade school at Hampton Institute cost about \$50,000. Blacksmithing, wheelwrighting, carpentry, painting, bricklaying, glass setting, shoemaking, harness making, mechanical drawing, and other like things are taught. There is a 3 years' course in the trades' work, going from the simplest piece of carpentry, for instance, up to more intricate branches of the trade. The students learn how to estimate for houses. After they have been in the shops for a year they go back for the third year into the trades' school, where they have more of the theoretical side. While they work in the trade school they have some literary work in the evening. (80-81.)

7. *Agricultural department.*—Mr. FRISSELL states that after the students graduate from the academic department some of them go into the agricultural department. Indeed, all the students receive some instruction in agriculture. Before they go into the regular academic department they are given instruction in soil, in plant life, and in animal life. There are two farms connected with the institute, one of about 100 acres, with an experiment station, and another of 600 acres.

There is a rather large home consumption for the products of the farm and the farm is within easy access of New York, Philadelphia, and Baltimore, as well as Newport News and Norfolk. The farm has two large herds of cows, one devoted to the making of butter and the other to the selling of milk. In connection with these, proper tests are made to determine the proportion of cream which comes from each cow. (81, 83.)

8. *Moral education and discipline.*—Mr. FRISSELL states that the manual training and the trade school have a great deal to do with the moral training of the students. Since the manual-training department was established the boys are more honest than they were before. In addition to this there are daily services with the reading of the Bible and prayer, but the school is entirely undenominational. Protestants, Catholics, and Jews contribute to its support. The board of trustees represents 6 denominations, none of which has a majority.

There is very little trouble at Hampton Institute in respect of the discipline of the students. Applications are received from students in their own handwriting and there is thus an opportunity to pass, to a certain extent, upon the boy's character before he enters the school. If he does not behave himself and does not seem to be in earnest, he is sent away. With the Indians it is a little more difficult. (81, 82.)

9. *Indian students.*—Mr. FRISSELL says that at Hampton Institute there are separate quarters and separate tables in the dining room for the Indians, but they are instructed in the same class rooms and in the same shops with the negroes. They work very well together and it is a very great help, especially to the Indians, and indeed to both races, for them to be together. This is the only experiment in which Indian education has been successful in connection with that of another race. The two races are very close together in many respects, and being placed side by side have been actually helpful to each other.

Quite a number of the Indian students come from the tribes of Wisconsin; a good many are Sioux; some are North Carolina Cherokees, and some come from the uncivilized tribes of the Indian Territory. There is no friction between the members of the various tribes. (78, 79, 82.)

F. Colored Normal, Industrial, Agricultural and Mechanical College of South Carolina.—Mr. T. E. MILLER, president of the institution, testifies that the Colored Normal, Industrial, Agricultural and Mechanical College of South Carolina is situated at Orangeburg, and is a manual-training college. In the industrial departments are taught blacksmithing, plumbing, wheelwrighting, carpentering, wood working by machinery, bricklaying, plastering, stone fitting and

setting, painting and graining for the boys, and laundering, cooking, and domestic economy for the girls. The witness intends to devote the second floor of one of the buildings which is about to be erected to a textile training school, if he can induce some private citizen or the Government to fit it up for that purpose. The superintendent of the brickwork, plastering, and stone setting is a black man named John R. Steele, whose only education was received at the high school at Charleston, and who is one of the finest architects to be found anywhere. The witness exhibited drawings of several buildings that had been erected by this architect with the labor of the students at about one-half of what they would have cost otherwise.

There are about 600 boys and girls at the college. All the teachers are colored, in accordance with one of the provisions of the by-laws of the institution. There are 7 trustees, all of whom are white men. The reason for not putting colored men on the board of trustees is that every year the president has to go to the legislature for an appropriation and he wants to have the best men in the State to stand between him and the legislature.

The first year the school was opened, which was in December, 1896, there were 1,100 students, but the illiteracy among this body was so great that it became necessary to pass a by-law cutting off all those who had not passed the seventh grade in the public schools; if the college would take all the boys and girls between 14 and 20, it would soon have had 2,000 to 3,000 students. It is hard to get boys and girls from the country to meet the requirements demanded in entering the school, because of the shortness of the school term in the country. No tuition is charged. One dollar incidental fee for the entire course of 7 months is all the student is required to pay outside of his board and clothing. The boarding department is run at a cost of not more than \$5 a month for each boarding student. Any boy, while building is going on, without detriment to his education, can earn \$4 a month, thus reducing his board bill to that extent. Of the 120 girls in the boarding department, 32 are employed at a salary of \$1.50 per month, thus reducing their expenses to \$3.50 per month.

The college has a farm of 65 acres of cleared land, and a swamp can be reclaimed so as to enlarge the farm to 120 acres. The witness manages the farm, and if the receipts are sufficient over and above expenditures, the trustees are obligated to pay in full one month's board for each boy or girl who has attended consecutively for 5 months of each school year. Experiments are conducted in the grass and forage crops. The girls and boys are taught dairying and the boys are taught scientific farming.

The courses in the college are elective and the student is permitted to choose whatever course he desires; he must take one trade. During the 3 years since the institution was started it has turned out first-class bricklayers, wheelwrights, blacksmiths, and plasterers; the buildings have all been erected by the students. The witness estimates the cost of the buildings—47 in number and 8 shops in addition—at \$73,000. Some buildings were erected by the State, but there was a fund from the land scrip given the State under the act of 1862, and the Morrill fund of \$12,000 a year can be used for other purposes in connection with the school. Several other buildings are in process of erection. On account of the poverty of the State, and because of the great need for schools of this character, Mr. Miller believes it is the duty of the General Government to aid in this matter. (121-123.)

G. Georgia State Industrial College.—Prof. RICHARD R. WRIGHT, president of the Georgia State Industrial College (colored), testifies that that institution began operations in 1891, having been organized under the land scrip fund and the Morrill fund, the first of which was originally given Atlanta University. The college is really part of the University of Georgia, the main part of the university being for white students, while this college is for colored students, both male and female. The income of the college is about \$16,000 per annum. There is no direct appropriation by the State. About 500 students and 17 teachers are connected with the college. No charges are made to students except for board and necessary expenses. The college is authorized to graduate pupils, giving them the degree of A. B. The pupils coming in from the highest grammar-school grade are supposed to finish the course in about 3 years. A complete course lasts 4 years.

The college is intended for training the students to go out among the people and assist them. The undergraduates are quite efficient mechanics. Boys who have never made any money before entering go away good workmen, earning from \$1.50 to \$3 a day. There is a farm of 50 acres connected with the college, 25 acres of which are used as an experiment station. The witness considers it very important that colored students should get the benefit of an industrial trade, and he thinks that 50 per cent of those who have gone out of the college have gone into the trades learned in the college. The first course is in manual training. Literary education is

carried along with this. After a student has reached a certain degree of proficiency in the literary course, he is permitted to choose a trade and can devote half a day to work in that trade until he has obtained a fair knowledge of it. He is paid about 5 cents an hour as an inducement for industry. Thirteen buildings on the ground have been built by labor of this kind. (198-199, 204, 208.)

IV. TEXTILE SCHOOLS.

A. General discussion.—Mr. SMITH, member of the board of trustees of the Lowell Textile School, testifies that manual training is intended to be a part of the public-school course, while the textile school has in view the application of science and art to the textile industry. In the textile school the textile business is learned, while in the manual-training school the student has his mind quickened and may be helped in the line of mechanics. The manual-training schools will eventually grow into trade schools. The difference between the textile school and the university is that in the textile school science and art are taught with the view of commercial and industrial application, while in the university the teaching is for the purpose of educating professional scientific men.

England and Germany have developed the textile industry very greatly. In a report of John C. Monaghan, United States consul at Chemnitz, Saxony, published in the Consular Reports for 1894, an article appears which is very valuable on this subject. Other consular reports contain similar articles. The Lowell Textile School is the pioneer in this line, but another will open for cotton at New Bedford, while the Philadelphia Industrial Art Institute has a department for textile education and some similar institutions are being established in the South. It is important that such a school should be near the mills, in order that the students may have a practical education as well as a theoretical one. (68, 69.)

Mr. Smith believes in helping to develop the manufacturing industry in somewhat the same way as the agricultural industry is helped by experiment stations. People will not go into textiles who have opportunities for other lines of business. Lowell is going into higher and finer lines. Nothing is made abroad which can not be manufactured at Lowell when the Lowell school shall have done its work. The textile machine companies in Lowell are manufacturing machinery equal to anything in the world from drawings made by boys who had received an education in the schools of the State and then a year at the textile school. The variety and quality of the goods manufactured are constantly increasing. (73.)

Mr. CHRISTOPHER PARKINSON BROOKS, managing director of the New Bedford Textile School, thinks the textile and trade schools ought to be encouraged, and says that in Europe the cities where they are located are benefited in a commercial way. In England and Germany it has become a custom for a young man wishing to enter the trade to go into a textile school for his education. He gets two or three years of the best training possible and is better fitted for active duties in the textile industry than he would be if he worked in the mill for a very much longer time. In the continental schools double or treble the fees are charged to foreigners. Many American students are in those schools.

In 1898 there were in the United States not over 400 scholars engaged in studying textiles. The movement is being developed in the South, and a school is being established in Atlanta, Ga., as a part of the Georgia School of Technology. A similar school has been attached to Clemson College, in South Carolina, and the Fall River authorities have appropriated \$25,000, which, with a like appropriation by the legislature of Massachusetts, will be used to establish a school devoted largely to cotton. (76.)

Mr. Brooks says textile education ought to be called trade education. There ought to be throughout the country schools for imparting education in all lines of trade, just as in textiles. The name technical school should be applied only to institutions which train professional men. A trade school forms a distinctly different class, in which a man can learn the technique of his business. (77.)

B. Lowell Textile School.—1. *Support.*—Mr. SMITH says that what is known as the four-school bill in Massachusetts gave to each city having 450,000 spindles permission to establish a textile school with State aid. This provision affected Lowell, Lawrence, Fall River, and New Bedford. Either of those cities that would contribute \$25,000 should receive \$25,000 additional from the State. Lowell complied with the terms and established the first textile school. Afterwards the legislature appropriated more funds, conditioned on the city of Lowell appropriating more, so that a total of \$95,000 was received from the State and city. In addition to this there have been some small contributions in cash from the manufacturers, who have also

contributed textile machinery of the value of \$50,000. About \$25,000 has been spent on machinery and the chemical laboratory. (70.)

2. *Origin and object.*—Mr. SMITH testifies the Lowell Textile School grew out of several conditions. Lowell was the first city where the power loom was set up. This was in 1822 or 1823. Nine-tenths of the industries of Lowell are textiles. Certain standards of plain goods were early established in that city, and the character of the goods has been so maintained that their trade-mark has become very valuable, especially in the Far Eastern market, in China. The South has developed a capacity to manufacture cheaply, and some of the Lowell mill owners have tended to go South and manufacture there. The Southern mills are practically an extension of the Lowell mills. As the industry developed into higher and finer lines, higher skilled labor became necessary, not only in weaving and spinning, but in mechanics, in order for Lowell to retain her position at the head of the textile industry; hence the textile school. (69.)

Mr. Smith says that, inasmuch as Lowell is so far from the source of raw material, it is necessary to use more brain and skill in order to reduce the share of the cost due to raw material, to the minimum—that is, to develop education in mechanics and textiles. An endeavor has been made to get Boston interested in commercial education, so as to find a market for the products of the mills. The textile industry is still in its infancy. A short time ago the imports of textiles amounted to \$100,000,000. This amount has been reduced largely, but America does not yet supply her home demand, and inasmuch as only about one-half the world has taken up the fashion of wearing clothes, there is a great opportunity for starting some system of commercial education to sell goods in the foreign markets. (72.)

3. *Departments and courses.*—Mr. SMITH says that the Lowell Textile School consists of 3 scientific departments: (1) decorative art, (2) general chemistry, and (3) mechanics. The other departments of the school are simply for the application of those sciences with a good deal of physics. The decorative art department is for instruction in the fundamentals of all specialties of decorative art, historic ornamenting, the conventionalizing of plant forms, color, etc. After the student has finished that course he takes up textile designing. The same course of instruction is necessary for book illustration, lithography, ornamental ironwork, and any other branches of decorative art. The chemistry department has a fine equipment and a 2-years course. As good a black dye has been developed at Lowell as the Hermsdorff. The value of the Hermsdorff dye, however, depends not only on the chemicals employed in it, but on the methods of manipulation. In the third scientific department the elements of mechanics are developed. Three-fourths of the textile business is mechanics, and that department is being rapidly developed by thoroughly educated mechanics. The other departments are the manufacture of cotton, woolen, and worsted yarns, and weaving. The board of trustees is made up from representatives of the great mills and business interests of Lowell, Boston, and Lawrence. (68, 69, 71.)

The course of cotton manufacturing runs through the entire 3 years. Pupils are admitted to the school on a high school or grammar school diploma, or on an equivalent examination. Algebra is very essential, also the languages, on account of their commercial value in selling goods. There are special courses arranged for the particular applicant, so as not to disturb the regular courses, but those special courses are not favored by the trustees.

It is possible to acquire as much knowledge in the evening schools as in the day schools at the Lowell Textile School, but the demand in the evening school is for a large number of special courses. There are 8 courses in the evening school. The night students seem to come in with more enthusiasm and show more appreciation than the day students. The night session is 2 hours, while the day session is from 9 to 5, with an hour intermission. (70.)

Prof. WILLIAM W. CROSBY, principal of the Lowell Textile School, testifies that there are four regular courses in the day school and five in the night school. Two of the day courses are cotton and woolen manufacturing; each teaches enough of the textile business to be complete. These courses include also cotton and woolen spinning. The third course is designing and the fourth chemistry. The courses in the night school are cotton spinning, woolen or worsted spinning, designing, chemistry and dyeing, and weaving. The night course embraces 2 evenings a week, taking 3 years to complete it. Anyone can enter the school, even though he does not complete the full course. One who knows how to read and write English and can do ordinary problems in arithmetic can enter the school and complete the course without difficulty. In order to become thoroughly familiar with machinery it is necessary for the student to be familiar with algebra. (74.)

4. *Tuition and students.*—MR. SMITH says the Lowell Textile School charges \$100 a year, or \$50 a term for the day course and different prices for the evening courses, probably averaging about \$5.50 per pupil. The city council makes appropriations for the evening school, conditioned on its being free to Lowell residents. The result is that the number of evening students has greatly increased, while the revenues have decreased. (70.)

There were 152 evening students and about 60 day students at the Lowell Textile School the first year. About the same number of day students and a few less evening students were there in 1899. In that year the school graduated a 2½-year class. It has been found almost impossible to hold a class to graduate, because the demand for advanced students is so constant, not only from the mills but from the managing houses in Boston, who use them in their designing departments with very excellent results. About three-fourths of the students of the Lowell school come from Massachusetts, four-fifths from New England, and the rest from all over the country. About four-fifths of the evening students come from Lowell and nearby villages. Those who come from other cities pay a nominal tuition of about \$5. The English people most readily appreciate these schools, but the Swedes also appreciate their benefits. The French Canadians have a latent artistic nature, and as advances are made in designing they are found to be a very valuable element. (70, 71, 73.)

5. *Graduates.*—Professor CROSBY testifies that the graduates of the Lowell Textile School take quite an advanced position in commercial or manufacturing lines upon graduation, although they are not yet competent to manage a mill. Commercial and mechanical education are combined. There is enough specialization to meet the demand. There are several young ladies in the school studying decorative art and textile designing. They have also worked on the hand loom and have made some very fine goods. Native Americans are not necessarily showing more adaptability than the foreign born students. (74, 75.)

C. New Bedford Textile School.—MR. CHRISTOPHER PARKINSON BROOKS, managing director of the New Bedford Textile School, testifies that that school is one of 6 in the United States, and was established under the same act as the Lowell Textile School. The legislature of Massachusetts appropriated \$25,000 on condition of the city appropriating the same amount. The trustees did not hasten the establishment of the school, but decided that the better plan was to erect their own building and equip it with as great a variety of machinery as possible. A building 100 feet long by 60 feet wide and 3 stories high is in process of erection and will be provided with a complete equipment of cotton machinery from the picker to the cloth room. Almost every machine-builder in the United States contributed some machinery, so as to give the students an opportunity to judge of the methods and merits of different machinery. The general features of the school curriculum are substantially the same as at the Lowell school. A special attempt is being made to make the New Bedford school a cotton school. This is following the German plan, which is considered the best. (75, 76.)

D. Textile schools in Germany and England.—MR. BROOKS testifies that Germany has had textile schools for 50 years and they are now considered the best in the world, though England outnumbers them both as to number of schools and as to the number of students. The German schools are under the control of the minister of trade and commerce and one of the regulations is that no silk school shall be established in a cotton locality or vice versa. At the Crefeld school an addition was built in 1897 for the purpose of taking up chemistry, bleaching, dyeing, etc., the goods being received from the local manufacturers, and the students were given an opportunity to get a knowledge of all the processes of the business, regardless of nationality. In some of the German schools foreign students are not received. Funds for the German textile schools have been raised almost entirely by a combination between the National Government, the local government, and the manufacturers in a proportion of about one-third each. The Massachusetts system is modeled after the German system. (76, 77.)

Mr. Brooks says that the technical schools in England are reported as containing 26,000 students and are located in some 300 or 400 cities and towns. Over 3,000 pupils are studying textiles. The British Government in 1884 appointed a royal commission to go to Germany to study the technical schools there, with the result that an appropriation of \$3,750,000 was made by Parliament annually for the purpose of technical education, including trade education of all kinds. Over 100 schools there are now teaching textiles to a greater or less extent, and England is to-day practically supplying the demand in this country for expert trained workmen. Twenty-five per cent perhaps of the trained workmen secured as the result of advertising are graduates from some textile school in England. (76, 77.)

V. AGRICULTURAL EDUCATION AND RESEARCH.

A. In foreign countries.—1. *Continental Europe, Japan, Australia, and Egypt.*—Dr. TRUE, director of the Office of Experiment Stations of the United States Department of Agriculture, calls attention to a great world-wide movement for the organization of technical education in agriculture and scientific research along agricultural lines during the last half century. Among foreign countries the movement has reached its highest perfection, in some respects, in France, Germany, and Belgium, where the system of agricultural education includes schools of various grades, from the university to the elementary school. Russia, Australia, and Japan are developing quite complete systems of agricultural education and investigation. Egypt has at least one very well organized agricultural college, in connection with which experiments are conducted, and the Sultan of Turkey has called upon the Secretary of Agriculture to recommend an expert to advise him how to organize agricultural education and experimentation in the Turkish Empire. The great commercial nations with which the United States is coming more and more into competition are every year increasing their efforts to perfect their system of agricultural education and investigation, and the United States can not afford to be behind the rest of the world in this respect. (52.)

2. *Great Britain.*—Dr. TRUE says Great Britain has no thoroughly*organized agricultural education or experimentation, though there are a few agricultural colleges, and in recent years grants of money have been made to a number of institutions. Reports of the experiment stations of France, Germany, and Belgium are being constantly translated and made available to the English farmer, and the experiment station at Rothamsted, England, which has been at work over 50 years, has also given him much valuable information. The great societies of agriculture in England and Scotland have also had an important part in the development of British agriculture; in some things, however, the British farmer has not been able to hold his own. The farmer of Denmark, who, with the help of the Government, has organized the business of dairying on a scientific basis, is able to go into the English market with butter, and to some extent drive out the Englishman. Dr. TRUE also explains the sale of Canadian cheese in England as a result of the very systematic and thorough work in agricultural education and investigation carried on in Canada, where the reports of the experiment stations are widely disseminated. (58, 59.)

B. American agricultural colleges.—1. *History.*—Dr. TRUE says the agricultural colleges are organized under the land-grant act of 1862, which granted each State and Territory 30,000 acres of land for each Representative or Senator in Congress, the proceeds from the sale of which were to constitute a fund for the maintenance of colleges in which agriculture and the mechanic arts should be taught. Before 1862 only a very few States had agricultural colleges. Michigan was the first State to establish such a college. Maryland, Pennsylvania, and other States had made some movement in that direction. (53, 58.)

2. *Statistics.*—There are land-grant colleges, Dr. TRUE says, in all the States and Territories except Alaska. Some of the States have separate institutions for the colored people, so that the total number of such institutions in 1898 was 64, of which 61 maintained courses in agriculture. Their resources of funds, lands, buildings, and equipment were valued at more than \$53,500,000, and their incomes amounted to more than \$6,000,000. The value of the addition made to their buildings and equipment in 1898 was estimated at \$2,800,000, paid for, in large part, by State appropriations. There were 2,611 persons teaching in these institutions, and the total number of students was 31,658, of which number 4,181 were in agricultural courses. (54.)

3. *Regular and special courses.*—Dr. TRUE says the agricultural college at Amherst, Mass., is the only purely agricultural college in this country. In 27 States and Territories the land-grant colleges are organized as agricultural and mechanical colleges. In 20 States they are the State universities, in which there is a department or school of agriculture. In all these institutions there is the regular college course in agriculture, shorter courses, commonly of 2 years' duration, and special courses in dairying, etc. There has been a great tendency of late years toward specialization. (53.)

4. *Criticisms.*—Professor DAVENPORT testifies that in cases where the land-grant funds were given to existing colleges they undertook to establish a department of agriculture, and the results were very unprofitable. In the establishment of a department of agriculture the usual method was to elect one man as professor of agriculture and then outline on paper an agricultural course, which differed from the scientific course only in the teaching of this one man. This professor had no chance to compete with other teachers in the university or to develop the science. There were no text-books, and he himself did not know his subject. The students were

required to take 2 years of science before commencing agriculture. In those 2 years they studied under the best teachers to be had, who were teaching familiar subjects with good text-books and the best reference books. When they went into the agricultural course they studied under one man, who had not been educated as a professor of agriculture, because there was no school in which he could have been educated. He was either some farmer who had not been successful, or else a chemist who had been more or less interested in agriculture. The result was that the students did not take kindly to such a course, and short courses of a few weeks were established in agriculture. These short courses usually developed into longer special courses in agriculture, in which agriculture ran parallel with the other lines of instruction. The dairy schools were successful, as were the schools of veterinary science. (137, 138.)

Professor Davenport testifies that there are colleges in the United States purporting to be agricultural colleges where only one or two men teach agriculture, and others where only one or two teach mechanic arts, although in those same colleges there are a large number of teachers of the ordinary college studies. The successful practice of agriculture requires more and more knowledge. It should be studied with a scientific spirit. Formerly there was one man teaching agriculture in a college, and botanists, chemists, and other scientific people teaching other things; and there was no advance made in agriculture until the subject was divided so that students could follow out particular lines of work. There is no more similarity between the dairy industry and horticulture than there is between agriculture and mechanical engineering. A farmer engaged in mixed agriculture ought to have a scientific knowledge of the chemical and physical nature of soils, of fertilizers, of the food crop which he grows for his stock, of the changes which these crops undergo by processes of preservation, and a great deal more. In other words, he should be familiar with a number of sciences. In the conduct of agricultural colleges consideration should be given not so much to the number of students as to the character of the subject that is being developed. The progress that is being made now is under a minute division of the subject, where each teacher is a specialist. Professor Davenport considers it unfortunate that the States did not recognize the fact that the funds received from the General Government ought to be used to develop the subjects rather than to give instruction to a great number of students. The boards of trustees were not wholly to blame, for it was easier to secure students on well-recognized lines of instruction that have been taught for many generations than to secure students on a new subject; boards of control are always pressed for funds and it is almost necessary to put the funds where there are students. The effect of this is, in many instances, to so curtail the agricultural course in many of the so-called agricultural colleges that students have been known to go to these agricultural colleges for a general scientific course, and afterwards go somewhere else to study the subject of agriculture itself. (136, 137.)

Professor Davenport thinks that the general public who have given the subject any thought at all and have any interest in agriculture or the mechanical arts have felt for many years that these Government grants, especially the one of 1862, have done very little good either to agriculture or to the mechanic arts. When the agricultural experiment station bill, known as the Hatch Act, was passed in 1887 the Government secured a great deal more information as to the operation of the law than it had taken as to the operation of the grant of 1862, with the result that much less difference of opinion as to the administration of that fund has arisen. (135, 136.)

Dr. HARRIS says the agricultural colleges are doing excellent work in mathematics and science, but he thinks they are not giving as much time as they should to the practical problems of agriculture. A study of the methods employed by the most successful farmers would create in the minds of the pupils an ideal standard as to the best methods to be employed. (45.)

Dr. TRUE says the general plan of teaching in agricultural colleges and schools of this country has not been well organized. The Association of Agricultural Colleges and Experiment Stations is studying the methods of teaching agriculture with a view to their improvement. Dr. True does not think, however, that the best plan is to have the students spend a considerable part of their time on the farm. The farm should be used as a laboratory is, though incidentally the student will get a certain amount of practice from this use. The aversion of farmers to "book learning" is a very great obstacle, but the number of farmers who read and profit by the literature available to them is increasing yearly, and the agricultural colleges are sending out every year young men thoroughly trained in agricultural lines, whose influence will be very great in promoting the progress of agriculture. (54, 59.)

5. *Disposition of funds in Illinois and Wisconsin.*—Professor DAVENPORT says the general assembly of Illinois, at the session of 1899, enacted that one-half the funds

XXXVIII THE INDUSTRIAL COMMISSION:—EDUCATION.

received from the land-grant act of 1862 and the Morrill Act of 1890 he devoted to instruction in technical agriculture, as distinguished from the sciences related to it and from other subjects. It specified matters connected with live stock, with the field and its crops, horticulture, and veterinary science, independent of chemistry, botany, zoology, literature, history, etc. Previous to that time, the trustees could use the funds as they saw proper. Illinois is the first State to adopt such legislation, but this division of funds was first made in Wisconsin by the board of trustees of the university, with excellent results. It enabled the university to secure more and better instructors and the attendance of students increased until now Wisconsin has one of the foremost schools of agriculture in the country, accompanied by original research. The witness recommends that in prosecuting any new work, if it has to be done out of funds not otherwise specified, a special appropriation should be had. (135, 137, 139.)

6. *Dairy school, Wisconsin.*—Dr. TRUE testifies that the special dairy school at the University of Wisconsin has already (1899) sent out about 800 trained butter and cheese makers, and has taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at this institution a short course in agriculture, having 190 students in 1898-99. Professor Henry, dean of the college, says that places have been found on farms in this one year for more than 50 young men, who got from \$2 to \$10 a month more because of their special training. (53.)

7. *Department of domestic science established in Illinois.*—Professor DAVENPORT says the University of Illinois has not had a department of domestic science connected with it for a number of years, but at the last meeting of the board of trustees such department was established, and will be opened in September, 1900. There is no special appropriation by the State for the study of domestic science. (135.)

8. *Audubon Sugar School.*—Dr. TRUE says a school for training sugar experts has been in operation a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State university, which has proved useful and has received financial support from the Sugar Planters' Association. (53, 54.)

9. *Agricultural colleges in the South.*—Mr. FRISSELL says that a number of agricultural colleges, some of them very good ones, have been started in the South. In these institutions a great deal of attention is being paid to industrial training. The trend in South Carolina is very largely toward agricultural education. The same is true in North Carolina and Alabama. In the latter State some of the daughters of the very best families are attending the industrial school. The agricultural schools all get the benefit of the Morrill Act. (85, 86.)

C. Cornell University.—1. *Endowment.*—Professor ROBERTS, director of the College of Agriculture at Cornell University, testifies that about 990,000 acres of land scrip were given to the State of New York. As New York could not own land in any of the public-land States, Mr. Ezra Cornell agreed to purchase all of the scrip at 60 cents an acre, locate and manage the lands, and pay taxes; and when they should be sold, pay into the university treasury all profits from the sale. He also agreed to give an endowment of \$500,000 if the State would give the entire land grant to one institution, and to give a farm of 200 acres if the State would locate the institution at Ithaca. Mr. Cornell located the lands largely in the pine districts of the Western States, and in 1894 he deeded all the lands to Cornell University. Up to August, 1900, \$4,292,628 had been realized on these lands over and above all expenses, and after paying into the State treasury 60 cents an acre for the scrip. Other wealthy men besides Mr. Cornell have given endowments and buildings, until now the university has an income fund of nearly \$7,000,000 and buildings and equipment valued at more than \$4,000,000. (211.)

2. *Courses in agriculture.*—Professor ROBERTS testifies that Cornell University provides a 4-year course leading to the degree of bachelor of science in agriculture. As comparatively few students desired this long and severe course, a special course of either 1 or 2 years was offered, upon which the student can enter without a formal examination, the director deciding whether the student can pursue the course profitably. Students in this course must be 18 years of age, and two-thirds of their work must be directly related to agriculture. There are about as many of these special students as of 4-year men.

More recently a winter course of 11 weeks was opened. About one-half the students elect dairying pure and simple. There are usually 60 to 70 applicants for this course, though but 50 students can be accommodated in the dairy building. Nearly all the students in the winter course are farmers' sons, and winter-course students are required to do at least two-thirds of their work in subjects directly related to agriculture.

required to take 2 years of science before commencing agriculture. In those 2 years they studied under the best teachers to be had, who were teaching familiar subjects with good text-books and the best reference books. When they went into the agricultural course they studied under one man, who had not been educated as a professor of agriculture, because there was no school in which he could have been educated. He was either some farmer who had not been successful, or else a chemist who had been more or less interested in agriculture. The result was that the students did not take kindly to such a course, and short courses of a few weeks were established in agriculture. These short courses usually developed into longer special courses in agriculture, in which agriculture ran parallel with the other lines of instruction. The dairy schools were successful, as were the schools of veterinary science. (137, 138.)

Professor Davenport testifies that there are colleges in the United States purporting to be agricultural colleges where only one or two men teach agriculture, and others where only one or two teach mechanic arts, although in those same colleges there are a large number of teachers of the ordinary college studies. The successful practice of agriculture requires more and more knowledge. It should be studied with a scientific spirit. Formerly there was one man teaching agriculture in a college, and botanists, chemists, and other scientific people teaching other things; and there was no advance made in agriculture until the subject was divided so that students could follow out particular lines of work. There is no more similarity between the dairy industry and horticulture than there is between agriculture and mechanical engineering. A farmer engaged in mixed agriculture ought to have a scientific knowledge of the chemical and physical nature of soils, of fertilizers, of the food crop which he grows for his stock, of the changes which these crops undergo by processes of preservation, and a great deal more. In other words, he should be familiar with a number of sciences. In the conduct of agricultural colleges consideration should be given not so much to the number of students as to the character of the subject that is being developed. The progress that is being made now is under a minute division of the subject, where each teacher is a specialist. Professor Davenport considers it unfortunate that the States did not recognize the fact that the funds received from the General Government ought to be used to develop the subjects rather than to give instruction to a great number of students. The boards of trustees were not wholly to blame, for it was easier to secure students on well-recognized lines of instruction that have been taught for many generations than to secure students on a new subject; boards of control are always pressed for funds and it is almost necessary to put the funds where there are students. The effect of this is, in many instances, to so curtail the agricultural course in many of the so-called agricultural colleges that students have been known to go to these agricultural colleges for a general scientific course, and afterwards go somewhere else to study the subject of agriculture itself. (136, 137.)

Professor Davenport thinks that the general public who have given the subject any thought at all and have any interest in agriculture or the mechanical arts have felt for many years that these Government grants, especially the one of 1862, have done very little good either to agriculture or to the mechanic arts. When the agricultural experiment station bill, known as the Hatch Act, was passed in 1887 the Government secured a great deal more information as to the operation of the law than it had taken as to the operation of the grant of 1862, with the result that much less difference of opinion as to the administration of that fund has arisen. (135, 136.)

Dr. HARRIS says the agricultural colleges are doing excellent work in mathematics and science, but he thinks they are not giving as much time as they should to the practical problems of agriculture. A study of the methods employed by the most successful farmers would create in the minds of the pupils an ideal standard as to the best methods to be employed. (45.)

Dr. TRUE says the general plan of teaching in agricultural colleges and schools of this country has not been well organized. The Association of Agricultural Colleges and Experiment Stations is studying the methods of teaching agriculture with a view to their improvement. Dr. True does not think, however, that the best plan is to have the students spend a considerable part of their time on the farm. The farm should be used as a laboratory is, though incidentally the student will get a certain amount of practice from this use. The aversion of farmers to "book learning" is a very great obstacle, but the number of farmers who read and profit by the literature available to them is increasing yearly, and the agricultural colleges are sending out every year young men thoroughly trained in agricultural lines, whose influence will be very great in promoting the progress of agriculture. (54, 59.)

5. *Disposition of funds in Illinois and Wisconsin.*—Professor DAVENPORT says the general assembly of Illinois, at the session of 1899, enacted that one-half the funds

Hirsch fund, which has a farm school on the European pattern, the boys living on the farm and having practical instruction in agriculture. Dr. True also understands that the Miller Manual Training School of Virginia gives some training in agriculture in this way. He regards this as only the beginning of a movement for secondary agricultural education, and believes that there is needed a development of secondary schools of agriculture in this country as they have been developed in Europe. (54.)

Dr. True says the education in agriculture at Hampton and Tuskegee is decidedly practical, though it has not gone very far. The experiment stations and agricultural colleges in the South are also teaching a great deal of value to the farmer. (59.)

2. *In New York State.*—Professor ROBERTS says there is an agricultural school under private auspices at Briarcliff Manor, of which Mr. George T. Powell is director. The academy at Belleville, N. Y., which is maintained quite largely by the farmers of the district, has established a chair of agriculture, and two graduates of the Cornell College of Agriculture have been elected principal and assistant. Professor Roberts expresses the wish that there were at least a dozen private agricultural schools in New York State. He emphasizes the need of agricultural schools where boys can find instruction in specific lines. There are a great many persons who do not readily acquire abstract knowledge. Such schools provide an opportunity for boys who love an outdoor life better than books, or who have no aptitude for the professions of their fathers, to become interested in plant and animal life. (224.)

E. Nature study and agricultural study in public schools.—1. *Cultural value.*—Professor ROBERTS thinks that something about plants and animals should be taught in every grade of every school, both in city and country, to round out the child's education. A child should go through the world with his eyes open and be able to speak with intelligence about ordinary things. There should be specialization in the latter part of one's education, but a broad foundation at the beginning.

Children should not be forced to study an agricultural text-book in the school, but every child can be made a better man or woman by coming in contact with living things and knowing something of them. Nature studies are rest studies; there is no lesson to be gotten and no examinations. The teachers induce each child to bring a box of earth and plant seeds, and the children are intensely interested in the work. (219, 220.)

Professor Roberts declares that the thing needed more than anything else in agricultural education is a differently trained teacher. The teacher should have knowledge of and a sympathy with animal life and be able to help the farmer to raise better potatoes and suggest means of destroying insect pests. "A father will try an experiment for his child's sake when he will not listen to the suggestions of the most distinguished professor." Professor Roberts believes that the school-teachers of New York should be required to pass an examination in the fundamental principles of agriculture, dairy husbandry, and horticulture before receiving their certificates.

This witness says that the authorities directing the educational forces of the State are coming more and more into sympathy with the nature-study work. Three or four experts from the university give courses at the teachers' institutes. (219.)

Professor Roberts says the awakening among the teachers in the rural districts of New York State is very marked. The aim of the Cornell College of Agriculture in the nature-study work is not to make farmers, but to help the people in both country and town and to stimulate the love for nature. A man or woman is not made until both sides of his nature are developed—the ideal as well as the utilitarian. The first effort in education should be to develop the physique; the second, to teach the boy or girl how to get a living; the third, to give as much as possible of the higher ideals. Professor Roberts believes that the true road to the highest mental development is by way of the utilities in youth. When the child is young the hand should be trained. The old education tried to educate one man's brain and another man's hand, and too frequently produced two monstrosities instead of a harmonious man. (225.)

Professor Roberts says he expected to be a farmer, and he does not believe that the short time he spent on Latin was of benefit to him. He should have devoted that time to learning something of his chosen profession. At 30 years of age he found himself without any real training for his profession of teaching agriculture except what he had picked up by practice. The boys who come to him he finds in the same condition. It is necessary to teach them things that should have been taught in the schools. University education is expensive, and it is humiliating to pay \$300 to \$1,000 a year and then be obliged to study things that any 14-year-old boy ought to know. (225.)

2. *High schools.*—Besides agricultural schools after the plan of these in Minnesota and Nebraska, of which there should be a number in different parts of a State, Dr.

TRUE suggests the introduction of outline courses in the theory and practice of agriculture in the high schools in or near rural communities. The cities are constantly developing their schools in manual and technical training, and the same thing ought to be done for agriculture. Many high schools already have at least one teacher chosen because of his ability to teach natural science. This teacher might just as well be a person who has studied scientific agriculture, and could offer an optional course in agriculture. Dr. True doubts the expediency of teaching agriculture in the larger cities, but thinks it might well be taught in a great many cities which are intimately associated with rural communities. There are cities of 50,000 to 60,000 inhabitants which are really rural centers as well as of agricultural population. In a city like Des Moines, for instance, there are probably in the high school quite a large number of students who have come in from the rural schools to finish their education, and in such a school it would be very appropriate to have an optional course in agriculture. (54, 58.)

3. *Elementary schools.*—Dr. TRUE says that the teaching of agriculture in elementary schools has been undertaken in some European countries, in some cases with considerable success. He has heard a teacher in a village school in Belgium giving instruction on milk to children 12 and 14 years old, who were much interested. The demand for the introduction of new studies into elementary schools, growing out of the broadening of human knowledge, makes it difficult to determine how far any special subject like agriculture can be wisely introduced. This kind of work requires special training and adaptability on the part of the teacher, and it has been difficult to find teachers who are properly trained. Generally speaking, Dr. True does not believe that the formal teaching of agriculture can be introduced into common schools under present conditions; but nature study can be introduced into the common schools, and in the rural schools the subjects which will naturally be selected will very largely be subjects relating to agriculture. This movement for nature study has begun very successfully in New York, and has spread into other States. This seems to Dr. True to be the coming movement for the improvement of rural schools in a direction to benefit agriculture. The State of New York makes an appropriation of \$35,000 to the College of Agriculture of Cornell University for extension work. A part of the money is to be spent in some experiments in different parts of the State, and a good deal of it is used in the preparation and dissemination of leaflets on nature subjects, which may be used by teachers in preparing simple lessons for use in elementary schools. The instructors in the agricultural college attend teachers' institutes and farmers' meetings to explain this movement. This work is so popular that it becomes an embarrassment to those in charge of it. The city schools see in it an opportunity to improve their course of study, and the demand for the leaflets has come to a considerable extent from city teachers. One of the greatest difficulties in such movements grows out of the conservatism of the farming population. (56, 57.)

4. *Teachers' classes in New York.*—Dr. TRUE says that the State of New York gives to every high school that organizes a teachers' class with a certain number of students a subsidy, varying according to the number of students. This enables the high school to get a teacher who has had instruction in the normal school to give an outline course in teaching. Dr. True thinks this plan might be applied to the teaching of agriculture in high schools. (55.)

F. Farmers' institutes and extension work.—1. *General statistics—Wisconsin.*—Dr. TRUE testifies that in some States the farmers' institutes are under the general management of the agricultural college or experiment station; more frequently they are under the direction of the State board or commissioner of agriculture, and in a few States there is a special State officer known as the superintendent of farmers' institutes. There has been a rapid increase in the number of institutes held. Dr. True estimates that they are now regularly held in about 30 States, and that during the year 1898-99 there were some 2,000 institutes, with a total attendance of about 500,000. When the institutes were first organized the farmers liked best to hear the successful farmers who had had experience in their immediate vicinity, but now the demand is more and more for experts who have made a wide study of agricultural problems. The institute workers have thus far been drawn largely from the colleges and experiment stations, but their staffs are getting overworked, and in one or two places at least there is the beginning of a movement to organize a special corps of institute workers. Dr. True thinks there should be in this country men corresponding to what in France are called traveling professors, who could ascertain what the needs of the farmers are, find out what is being done in the experiment station and in the department of agriculture, and disseminate the information at farmers' institutes and other farmers' meetings. In Wisconsin there are now held annually 120 institutes, with an average attendance of more than 50,000. The best addresses are published in the annual institute bulletin, of which 60,000 copies are distributed,

a copy being put in every school library in the State. The State makes an appropriation of \$12,000 annually for this work. Massachusetts, Minnesota, Indiana, Michigan, Pennsylvania, Ohio, and New York are also mentioned as States in which the institute movement has been especially successful. (55, 56.)

2. *New York.*—Professor ROBERTS states that when he went to Cornell there were 3 students in the College of Agriculture and about 3 persons constituted the teaching force, exclusive of those who taught purely science. By reason of prejudices and lack of funds the college did not grow rapidly until about 1882 or 1883, when an attempt was made to reach the farmers through farmers' institutes. The first institute in the State was held at Cornell University. Later this resulted in the State appointing a commissioner of dairy husbandry, whose office was expanded later into that of commissioner of agriculture, and all the institute work was placed under the commissioner's control. The commissioner appoints a director, who selects from 10 to 15 experts. The force is divided into 3 or 4 groups, and is thus enabled to hold from 300 to 400 institutes during the winter, and to reach nearly every village and hamlet in the State. There is an annual State appropriation of \$10,000 for carrying on the institute work. The demand for the institutes is greater than can be met. (211.)

Professor Roberts testifies that some 8 years ago the people in the western part of New York, where there is much interest in fruit growing, asked for a speaker to come to their aid, and a lecturer was sent from the College of Agriculture at Cornell. He gave such good satisfaction that they asked for others; but it was found that the instructors at the college could not meet the demand made upon them, besides carrying on their work at the university, and more men were needed. The farmers secured an appropriation of \$8,000 for carrying on horticultural investigations in the western part of the State; the next year the appropriation was doubled and the territory and work enlarged. The following year the appropriation was \$25,000 "for the promotion of agriculture throughout the State." During the past 2 years the farmers have secured an annual appropriation of \$35,000 "for the promotion of agricultural knowledge throughout the State." A beginning was made by holding schools of agriculture and horticulture on the farms or at little hamlets. It was found that large numbers were not reached in this way, and the idea was conceived of reaching the teachers of the public schools. Lecturers were sent to the teachers' institutes, and nature-study leaflets and similar publications were sent out. Still later the summer school of nature study for teachers was organized at the university. This was continued for 2 years; the teachers who attended were largely from the cities, and while it was maintained successfully it was believed that it was not reaching the farmer and his children direct. So the school was discontinued, and leaflets and other publications substituted in a measure for it.

The work for the promotion of agricultural knowledge throughout the State is a part of the work of the College of Agriculture, and is carried on along three lines: (1) Instruction at the university (the winter course); (2) instruction throughout the State to farmers, farmers' wives, school-teachers, and school children; (3) cooperative experiments throughout the State. (214, 224.)

3. *Traveling schools.*—Dr. TRUE says that besides the ordinary farmers' institutes men from the agricultural colleges and experiment stations sometimes take up a particular line of instruction in a special locality in such a way that those in attendance get a more systematic survey of the subject than at the ordinary institute. Only a beginning has been made in this work in this country, but it has been attempted abroad to a considerable extent. In England a number of traveling dairy schools are in operation each season. (56.)

4. *Reading courses and leaflets.*—Dr. TRUE speaks of the attempt of Pennsylvania and some other States to organize regular courses of home reading for farmers. The Pennsylvania State College, which was the first to do this in any thorough way, has enrolled (1899) between 400 and 500 persons who are pursuing these reading courses. A syllabus of the course is sent to each of these students, certain books are recommended, and questions are asked. The answers to the questions in many instances show a surprising degree of proficiency. The work is growing rapidly and taxes the resources of the college. (56.)

Professor ROBERTS testifies that the farmers' reading course was established by Cornell University in 1898. During that year and the 2 years following 22,492 farmers joined the course. Farmers' reading clubs have also been organized, usually meeting at the residence of some club member. There are 48 of these clubs, and the total membership is about 1,000. Farmers' wives called attention to the lack of publications adapted to their wants, and accordingly a farmers' wives' reading course was established. This has a membership of 4,747. After being organized only 1 year the school-teachers made a similar request for help in nature study, and there are now 11,500 teachers receiving the teachers' leaflets. Professor Roberts submits specimens of the teachers' leaflets and of the farmers' reading lessons and quizzes, to show

how the work is conducted. He says the aim is to work without formal text-books, and to teach the pupil through personal observation. (214-218, 225-240.)

Professor Roberts submits a number of appreciative letters from persons in New York and elsewhere following the reading courses. One reports that he has aroused the envy and hatred of his neighbors by raising 10 bushels of grain and 3 of potatoes to their one. One says that through the lessons he has obtained 100 bushels of potatoes of salable size from one-half acre of ground in an unusually dry year. A Canadian farmer boy writes: "After reading the 5 lessons on the soil and the plant . . . every stone, every lump of earth, every sandy knoll, every hollow, had a new interest." Professor Roberts refers to the letters as showing that the workers are in touch with the farmer. He quotes from an article by Professor Craig the following statement of the object of correspondence courses: "Correspondence courses in agriculture strive to repair the defects of early education of the farmer, with a view to placing him in full harmony with his surroundings." (222, 223.)

There is also a home nature-study course in which 1,400 are registered. The instructors who go out through the country visit these clubs, as well as the farmers who are conducting experiments, and give lectures. (220.)

Professor Roberts says the leaflets are adapted to quite young minds as well as to more mature ones. There are different classes for different classes of pupils. One instructor has full charge of the farmers' reading course, another of the farmers' wives' reading course, another of the school-teachers' course, and still another of the children's course. An entirely different sort of publications goes to investigators, giving directions as to what is to be done. (221.)

5. *Junior naturalist clubs.*—Professor ROBERTS says it is found that an effort must be made at the bottom, and so junior naturalist clubs have been formed throughout New York State. There are 764 of these clubs, with 20,321 members. The membership dues consist in writing a letter at stated times to the head of the nature-study bureau at Cornell. The natural objects studied give material for drawing lessons. (220.)

6. *Experiment stations.*—1. *History and statistics.*—Dr. TRUE says that experimenting in agriculture began in a regular way in this country with the establishment of agricultural colleges. The first regularly organized experiment station was started in Connecticut nearly 25 years ago. Soon after, stations were organized in California and other States, until in 1887 there were 17 experiment stations in 14 different States. In that year Congress passed the Hatch Act, giving to each State and Territory \$15,000 a year for the maintenance of an experiment station, which must be in connection with a land-grant college, except where stations were already organized. The pioneer stations were largely occupied in organizing the control of commercial fertilizers and demonstrating the necessity of basing their purchase on the manufacturers' guaranty of their chemical composition; but they also made sufficient scientific investigations to indicate that they might render much more service with broadened resources. The organization of new stations under the Hatch Act was therefore taken up with enthusiasm, and stations were soon in operation in every State and Territory. It was easy to find in the faculties of the agricultural colleges men competent to undertake agricultural investigations, and the equipment of the colleges could also be used. The lines of work had already been marked out to a considerable extent by the older stations, by some institutions in Europe, and by the United States Department of Agriculture, the scientific divisions of which already constituted a great experiment station. It was therefore possible for the new stations almost immediately to undertake useful investigations and begin the publication of information. In 10 years more than \$10,000,000 have been expended in the maintenance of experiment stations, of which about \$7,000,000 came from the Federal Government. The total expenditure is calculated to be \$1 for every \$3,000 worth of agricultural products. During the same period the stations have published 3,000 bulletins, exclusive of press bulletins, and 500 annual reports. Their bulletins are sent regularly to more than 500,000 farmers, and about 5,000,000 copies are annually distributed. Separate stations are supported in some of the States, so that the total number of stations in the United States, not counting branch stations, is 54, of which 52 receive appropriations under the Hatch Act. The total income of these stations for the fiscal year 1898 was a little more than \$1,200,000, of which \$720,000 was from the National Treasury. Small revenues are derived from the farms. Sales of farm products by the stations in 1898 amounted to \$65,356.25. The Office of Experiment Stations also had an appropriation of \$35,000 for its work, including \$5,000 for an investigation in Alaska. Experiment station work has been begun in Alaska under the direct supervision of the Department of Agriculture. There is also a very successful experiment station in the Hawaiian Islands, under private auspices, but under the direction of a man formerly connected with the Department of Agriculture and with the Louisiana Experiment Station. (60, 61.)

Dr. True says the experiment stations employed in 1898, in the work of administration and inquiry, 669 persons, including 75 directors, 148 chemists, 71 agriculturists, 10 experts in animal husbandry, 77 horticulturists, 29 farm foremen, 21 dairymen, 50 botanists, 46 entomologists, 26 veterinarians, 20 meteorologists, 11 biologists, 11 physicists, 6 geologists, 19 mycologists and bacteriologists, 7 irrigation engineers, 15 in charge of substations, 23 secretaries and treasurers, 10 librarians, and 46 clerks. During 1898 the stations published 406 annual reports and bulletins, besides press bulletins, which were widely reproduced. The mailing lists of the station aggregated half a million names. There is a steady increase in the correspondence with farmers and in the number of calls upon station officers for public addresses at institute meetings and other meetings of farmers. The station officers contribute many articles to agricultural and scientific journals and have written a number of books on agricultural subjects. (62.)

Mr. SIMPSON says the Federal Government made an appropriation of \$15,000, known as the Hatch fund, to each State for experiment stations. These stations proved to be failures in a large measure, from the fact that the bulletins sent out by them were along scientific lines, and the farmers did not read them. Afterwards, the Morrill Act, to supplement the Hatch fund, made the appropriation \$25,000 to each of the States to be expended for purposes of agricultural education. Clemson College is getting the benefit of some of the experiments because they are carried on under the eyes of the students who can see and understand not only the practical results but the scientific objects to be accomplished. (102, 103.)

Professor ROBERTS says there are two experiment stations in New York. The Cornell station was given the Federal appropriation of \$15,000 until a few years ago, when the legislature gave \$1,500 of it to the State station at Geneva for the purpose of securing for that station the franking privilege. The relation between the two stations is described as "one of cooperation in the most friendly manner possible." Cooperative bulletins have been published, written partly at the Geneva station and partly by a Cornell man. (224.)

Professor Roberts says the Cornell Experiment Station is a department of the College of Agriculture. (224.)

2. *Character of work.*—Dr. TRUE classifies the work of experiment stations under four heads: (1) Police duties connected with the control of fertilizers, dairy products, etc.; (2) study of the natural conditions and resources of the State; (3) demonstration experiments showing how the results of science can be adapted to local conditions; (4) scientific investigations to discover new truths and new applications of old principles. The experiment stations conduct a wide range of scientific research in the laboratory, the plant house, the field, the orchard, the stable, and the dairy. Dr. True mentions the following subjects as among those to which several stations have devoted attention: Soil investigations; drainage, seepage, and irrigation; fertilizers; methods of cultivation, varieties, etc., of the more important crops; feeding stuffs; dairying; chemical and botanical work; horticulture; forestry; injurious insects; animal diseases; bee culture; poultry culture. (60, 61.)

Dr. True says the experiment stations, especially in the East, have been engaged in the investigation and inspection of commercial fertilizers, and have largely prevented the sale of fraudulent goods. In the State of New York alone over 900 brands of fertilizers were examined in 1898. The stations have also done much to expose extravagant claims made for fertilizers and to show the advantage of home-made fertilizers. The stations have also inspected adulterated foods, especially dairy products, butter increasers and preservatives, concentrated feeding stuffs, quack medicines for stock—especially hog-cholera remedies—and have exposed frauds in creamery construction and equipment and in dairy apparatus. (62.)

Dr. True speaks of the important work of the experiment stations in investigating injurious insects and plant diseases, and says that the Wisconsin station, by discovering an effective curd test, has provided an effective means of detecting tainted or defective milk at cheese factories, which had caused a loss of from \$100,000 to \$200,000 each summer in that State alone. (62, 63.)

Dr. True says:

The agricultural colleges and stations have been largely instrumental in securing State laws for the inspection of fertilizers, nursery stock, dairy products, falsified foods and feeding stuffs, creamery glassware, paris green, and for the suppression of plant diseases and injurious insects. They have also aided in the passage of laws establishing farmers' institutes, fixing a milk standard, organizing associations for the promotion of agriculture, quarantining animals for contagious diseases, sale of oleomargarine, the apportionment and measurement of water for irrigation, State aid for highway improvement, etc. (62.)

Dr. True gives a number of instances in which experiment stations have aided in the development of existing methods, crops, or industries in the various States. The Louisiana Experiment Station, by developing new methods of sugar making, has

reduced or removed previous losses, and has helped the sugar industry also, by improving the cultivation of sugar cane. In Connecticut the quality of the wrapper-leaf tobacco has been improved. In New York animal industry and dairying have been helped. The Missouri station bulletin on the draft of wagons with broad tires was thought so highly of by the League of American Wheelmen that a large edition was republished by the league. In Connecticut the Storrs station has studied the nutritive value of forage crops, and conducted cooperative experiments with fertilizers and with nitrogenous feeding stuffs. The Ohio station seems to have shown that more stock food per acre can be secured in Ohio from corn than from sugar beets, and has shown the superiority of shallow over deep cultivation of corn in Ohio. The Mississippi station has done an important work for the South in developing the growth of forage plants and the live-stock industries, together with a demonstration of the value of cotton seed and its products for stock. In Utah the methods of tillage have been improved with reference to the conservation of moisture, and studies of alfalfa have been made. The Nebraska station has promoted the growing of alfalfa and winter wheat instead of spring wheat, so that the State has become a large wheat producer, and its investigations of subsoil have resulted in increasing the yield of corn in some cases 10 to 30 bushels an acre. In Vermont there have been investigations of sap flow as related to the maple-sugar industry. In California seeds and plants of improved varieties have been distributed, and the wine and olive industries have been helped. In Oklahoma effective investigations have been made in the culture of kafir corn. In Rhode Island there have been important investigations in the feeding and breeding of ducks and geese. In Arkansas there have been experiments on economical methods of producing beef in connection with the raising of cotton. (63, 64.)

The Pennsylvania station and many other stations have investigated sugar beets. Their work, in connection with that of the Department of Agriculture, has shown definitely where good sugar beets can be grown. The Maine station has shown that apples can be raised in Aroostook County. The Storrs station, in Connecticut, has made important investigations in nutrition. The Ohio station has originated a method of watering greenhouses by subirrigation. In Florida the introduction of the velvet bean has resulted in the saving of thousands of dollars on fertilizers. Cassava is another new crop, from which starch can be made cheaply. The California station has been engaged in soil investigations, especially on alkali lands, resulting in bringing into agricultural use large tracts of land which were thought to be useless. Kafir corn was introduced into Kansas by the Department of Agriculture, and taken up by the Kansas station. In 1898 over half a million acres of this corn, valued at \$6,000,000, were grown in Kansas. It is a dry-soil plant, which is a great advantage for certain regions. (64.)

Professor DAVENPORT testifies that in the last 10 years the experiment-station work has been largely instrumental in establishing colleges of agriculture, because that work is entirely along technical lines and demonstrates to the people the value of the scientific study of agriculture. Since the establishment of the experiment stations the land-grant colleges do not issue circulars instructing the farmers on any subjects. Wherever there is a college there is an experiment station, and in every case the publication is made through the the experiment station rather than through the college, because that was the idea of the Hatch Act and because it is less expensive to the college to distribute the experiment than it would be to send out the circulars. (137.)

Professor ROBERTS testifies that the \$13,500 appropriation to the Cornell Experiment Station is used to conduct investigations, publish bulletins, and furnish experts when called for to investigate serious outbreaks of insect pests or of animal or plant diseases. About 12 bulletins are published annually, besides the annual report. The mailing list runs from 20,000 to 30,000, being made up from requests from the farmers. The work of investigation is divided into the bureaus of general agriculture, horticulture, dairy husbandry, entomology, and chemistry, each with a professor at its head. Each bureau has a man available to send to the relief of the farmer in case of outbreaks of pests or diseases. All sorts of questions are received at the director's office, distributed to the various bureaus, and all answered, sometimes as many as 100 a day. (212, 213.)

Mr. FRISSELL testifies that 15 acres of the farm at Hampton Institute is devoted to an experiment station, on which the different kinds of plowing and the results from different kinds of fertilizers, etc., are shown. The students are taught to experiment in the growing of various crops and fruits. There is a small 4-acre tract, and a student is given the opportunity to show what he can do with that. There is a small barn, a small orchard, and a small house on it, and it has been demonstrated that this farm is a sufficient support for an ordinary family. (83.)

Professor ROBERTS says that field experiments and laboratory experiments should go on simultaneously. The amount of plant food is easily determined in the laboratory, but the chemist can not tell what proportion of the plant food is available, since availability depends upon heat, moisture, and many other factors. The plant tells an intelligent man more than the chemist can, but the chemist may solve problems which the farmer can not, and assist in solving those which require both the farmer and the chemist. (213.)

Professor Roberts testifies that at the Cornell station numerous experiments are made in cultivation and tillage. The station tries to induce the farmers to experiment for themselves. In 1900 there were 199 experimenters with sugar beets, field beans, potatoes, and fertilizers. Before the sugar-beet factories at Binghamton and Lyons were built experiment-station experts were in the field to help the farmers master the new industry, and teachers traveled, largely on bicycles, from farm to farm. Each experimenter may have 5 or more plots with different varieties or with different tillage or different kinds of fertilizers. Small quantities of fertilizers are sent out to the experimenters, perhaps 15 to 30 pounds in each sack, and the farmer puts these various fertilizers on different areas in different combinations, in order to determine in what plant food the soil is deficient. As far as possible a field agent is sent to see that the work is properly done. Better tillage of the land has been emphasized perhaps more than any other one subject, with very marked beneficial effects. Publications are sent to the investigators, giving specific directions as to what is to be done and how to do it, and blanks are furnished for reporting results. When the reports are received in the winter they are discussed, digested, and, so far as may be, published as a bulletin. (213, 221.)

Professor Roberts says that for 8 or 10 years strenuous efforts have been made to improve the potato culture of New York State. The average yield in the State was less than 100 bushels, but it was found at the Cornell Experiment Station that from 200 to 400 bushels could be raised without fertilizers by improved tillage. About 300 potato growers reported results in 1900, and with one exception said that the new way was a great improvement. (222.)

3. *Coordination of work.*—Dr. TRUE says the experiment stations are brought into intimate relations with each other and made to constitute organic parts of a national system through the Association of American Agricultural Colleges and Experiment Stations and the Office of Experiment Stations of the United States Department of Agriculture. The association holds annual meetings, at which questions of general policy and management are discussed, and papers on special topics read. Its proceedings are published by the Department of Agriculture. The Office of Experiment Stations examines the work and expenditures of all the stations, publishes popular and technical summaries of their investigations, collects and disseminates information regarding the work of similar institutions throughout the world, suggests lines of inquiry, aids cooperative enterprises, and, in general, aims to assist the stations in developing and strengthening their work. Nearly 1,000,000 copies of its publications are distributed in a year. (62.)

4. *Criticism and valuation.*—Dr. TRUE says there has been to a considerable extent a failure to understand the real purpose of the experiment stations and disappointment that they have not undertaken more farming operations. The act under which they operate was framed with reference to the needs of institutions where science was to be used for the benefit of agriculture; so that the stations work from the scientific to the practical, and do not carry on farming operations to show what good farming is, after the manner of the model farm. Dr. True says, also, that political influence has worked too actively in the organization of the stations. In most of the States the board is appointed by the governor of the State, and the membership can be more or less shifted for political purposes. There have been shifting policies in the management of the institutions, and the officers have been changed too frequently. There has been a lack of proper organization. The lack of thoroughly trained men has been one difficulty, and there has been a haste for immediate results and the demand for too many kinds of work. (64, 65.)

Dr. True adds, however, that the experiment stations have every year a better equipment and better trained men; they divide their work more thoroughly among specialists and introduce new lines of work. There is being made a clearer distinction between the educational work which the college can properly do and the experimental work which the station ought to do. Finally, the stations have in an increased measure the cordial support of Congress, State legislatures, and the people. (65.)

"The American experiment station," Dr. True says, "is the most complete and comprehensive system of agricultural research which the world has ever known. Its publications reach farther and come home more closely to great masses of our

farmers than is the case in any other country. If any farmer in the United States is not acquainted with the latest information which agricultural science has to give him regarding the means for improving his art, it is because he has neglected to avail himself of the public agencies created for his benefit." (62.)

Dr. True sums up the general results of the movement for agricultural education and research in the United States substantially as follows: (1) A body of trained leaders and experts; (2) an up-to-date American literature on American agriculture; (3) free distribution of a vast amount of accurate and useful information; (4) a breaking down of the tradition that agriculture is of necessity a nonprogressive art; (5) the colleges and stations have been an important factor in making the state of the ignorant, shiftless, and nonprogressive farmer worse than formerly. It is becoming clearer every year that to be successful in agriculture, as in other arts, one must be progressive and seek up-to-date information and ideas. (65, 66.)

5. *Need of additional stations in the South.*—President WRIGHT, of the Georgia State Industrial College, thinks that the United States Government should establish additional experiment stations in the South for the benefit of the colored farmers. The present experiment stations are used only by the white farmers and are considered by the colored people to have been instituted for the benefit of the whites only. The races will not mix in work of this kind. It is true that very few of the colored farmers know there is such a thing as an experiment station in any of the States, and very few of them, perhaps, would patronize the station or would know anything about it even if it were established; but those who would take advantage of the information that could be gathered at these stations could go back home and instill new life into the farming industry. The colored farmers do not attend farmers' institutes, and do not receive any bulletins from the experiment stations. The experiment station in Georgia is located at Griffin and has issued 150 bulletins. The witness's idea is that the experiment station for the colored farmers should be in the nature of a school. (203, 208, 210.)

VI. AGRICULTURE IN THE SOUTH.

A. Laws and customs.—1. *The transition from slavery.*—Dr. CHARLES W. DARNLEY, Jr., formerly Assistant Secretary of Agriculture and now president of the University of Tennessee, testifies that after the civil war there was a tremendous industrial revolution in the South which changed the entire labor system and almost the entire social system, but affected agriculture more than any other industry. Before the war the condition of the Southern planter was in many respects an ideal one. All the better land in the lower country was held in large tracts and cultivated by slave labor under the direction of the owners or overseers. A single proprietor would often own a number of estates in the same section, and the more prosperous ones were constantly adding new tracts to their holdings, largely for the reason that the better class of slave owners would not sell their slaves except as a punishment, and it became necessary to purchase new lands in order to supply work and sustenance for the rapidly growing negro families. A large number of these slave owners were greatly relieved and felt that a burden had been lifted from their shoulders when the slaves were freed.

From an industrial standpoint the old plantation organization was a perfect one. Great ability was required to manage it, and the owner of the property was kept busy looking after it and his slaves. The South was very prosperous between the years 1850 and 1860. The model planter of those days produced at home almost everything that was needed to feed and clothe the slaves, and with the exception of the iron and steel, the finer groceries, a few medicines, and some of the richer cloth for the use of his family, he produced everything that was used upon the plantation. His money crop, whether wheat, cotton, or sugar, was made at a minimum cost, and he usually sold enough food products to enable him to count as clear profit everything received from his principal crop. The abolition of slavery caused the destruction of this system and made it necessary for Southern planters to organize their industry upon a new plan. Many of them strove for years to carry on with hired labor a system similar to that prior to the war. Except in a few cases of planters who had very rich lands remote from the towns, the effort to farm according to the old method was not successful. Labor was completely disorganized; the planter was under no obligation to maintain the negro except when he wanted him; being thrown upon his own resources the negro was compelled to sell his unskilled labor where the supply was the greatest, and as a result he suffered more than the white man. Under the stimulating influence of high prices for the staple articles of cotton, sugar, and other money crops of the South, the Southern planters divided their great estates into small farms and rented them out to tenants, usually for a part of the crop.

XLVIII THE INDUSTRIAL COMMISSION:—EDUCATION.

About 1870 the average Southern farmer had a small farm under his own management and the remainder of his land let out to negro tenants, to whom he generally supplied the stock, implements, and food with which to make the crop. Both the landowner and the renter devoted their attention almost wholly to the growing of cotton or tobacco, and as these products brought good prices for a number of years, practically all the supplies of bacon, flour, and other food products and fertilizers were purchased from the commission merchant to whom the crop was delivered at the end of the year. When the prices of these staples declined, the farmer still continued to grow the same crops and follow the same system of purchasing food supplies, with the result that in a year or two both the landowner and the tenant found themselves and all their property mortgaged to the commission merchants for several years ahead. The more unfortunate ones and those who were careless and thriftless, especially the negro renters, were soon forced to the wall, mortgages were foreclosed, and they were sold out. In many instances the large plantations passed into the hands of the commission merchants to reimburse them for the advances made. The more thrifty planters and tenants then began to diversify their crops, and instead of devoting their whole attention to the growing of cotton and tobacco began to grow the necessary food crops, thus going back to the old system prior to the war. The result of this industrial change was that many of those who had been in debt were able to lift their mortgages, and the condition generally of the agriculturists was very greatly improved. The South to-day, especially in the Mississippi and Alabama region and in the Atlantic Coast States, to a certain extent is raising practically all its food products, as it is very well able to do. The witness submits some tables in connection with his testimony, showing the relative production of corn, hogs, and wheat in the States of North Carolina, South Carolina, Georgia, and Alabama in 1860 and 1890. In every instance the production of each one of these food products in 1860 is largely in excess of what it was in 1890, in some instances almost twice as much, even though the population in 1860 of these States was only about two-thirds of what it was in 1890. (175-179.)

Dr. Dabney testifies that, as a result of the industrial revolution in the South, especially in Alabama, the Jews, who were commission merchants and advanced money to the planters and tenants on their crop, taking a mortgage for the advances, foreclosed such mortgages and became the owners of some of the finest estates in northern Alabama. The Jew went there as a merchant, but is now a farmer and is using the best business methods with hired labor, studiously avoiding the tenant system. The Jews are helping to build good roads and schoolhouses, and are developing the country in a public-spirited way, and since they have become landowners they have become remarkably good citizens. (179.)

2. *Progress of diversification and intensive culture.*—Dr. DABNEY testifies that the leading crop connected with the industrial revolution of the South was corn, and the increase in the production of this article has been chiefly in those States which formerly produced the most cotton and tobacco. The States of Georgia and Mississippi each produced 12,000,000 bushels more corn in 1899 than in 1893. Alabama produced 17,000,000 bushels more in 1899 than in 1893, and Texas 50,000,000 bushels more in the same time. This increased crop of corn increased the corn stover and gave rise to a great increase of food for both man and beast. It did away with a large importation of grain and meats from the West. There was a great increase in the acreage of hay and other forage crops. In the States of Alabama, Georgia, Arkansas, Mississippi, South Carolina, and Florida the acreage increased between 1879 and 1899 3, 5, 7, 10, and 23 fold, respectively. According to the Department of Agriculture, there were 3,638,000 tons of hay produced in the South in 1899. This means more and better stock and more and better milk and butter. The Department of Agriculture reports that there were 3,000,000 more hogs in the cotton States in 1899 than in 1890. The reports of the railroads show a great reduction in the importation of breadstuffs and meats into the South from the North and West in recent years. In 1880 there were 2,500,000 milch cows in the South. In 1890 the number had increased to 2,800,000, and in 1899 to 3,000,000. The passage of laws in the Southern States requiring stock to be kept at home or fenced in has led to the elimination of worthless cows and the better care of those remaining. The production of cheese has doubled in recent years. It has become quite an industry in South Carolina, where it was formerly almost unknown. The figures with regard to poultry are as favorable as are those for dairy products. (179-181.)

Dr. Dabney testifies that, under the influence of the changes in the industrial system of the South during the last 30 years, the size of the farms has greatly decreased and the area of unimproved land has decreased. He submits tables for the States of North Carolina, South Carolina, Georgia, and Alabama to substantiate this statement, and says that in North Carolina 72 per cent of the farm land was unimproved in

1860, and only 65 per cent in 1890. Practically the same rate of decrease is shown for the other States mentioned. The total value of farms, including buildings and fences, increased very rapidly between 1880 and 1890. A table submitted for the four States mentioned shows the increase to have been practically 50 per cent in each instance. The witness says that, inasmuch as these values are based exclusively on the statements of the farmers themselves, who are known to be very conservative in making returns of their property for fear of increased taxation, it may safely be assumed that the present actual values are much higher than those given. The use of fertilizers in the South has increased enormously with the movement for intensive culture. In 1890 there were 20,500,000 tons of fertilizers used, as compared with 2,300,000 tons in 1880. In addition to this, the farmer of the South has learned to use farm manures and prepare fertilizers at home from cotton seed or the cheap phosphates. Intensive farming has come to stay. The reorganization of the agricultural and other industrial conditions in the South is a sure precursor of new growth and progress. The people of the South are already enjoying a period of greater prosperity. Cotton, cattle, and mules are bringing better prices than they have for many years, and the cereals and tobacco are bringing in good returns also. (181, 182.)

Mr. FRISSELL believes the only hope for the South lies in the diversification of crops. There is no difficulty in any part of that section in bringing this about. The present depression of agriculture in the South (1899), especially in the cotton-growing States, is due almost wholly to the fact that cotton has been grown almost exclusively and the food products purchased from other States, whereas they should have been grown at home. The present tendency, however, is for the negro to grow practically all his food products and thus not be dependent upon cotton for his living. He is thus enabled also to free himself to a very great extent from the crop-lien system. (86, 87.)

Dr. DABNEY testifies that by the diversification of crops the soil is increasing in fertility. Some soils are improving where the diversified methods have been used for only 4 or 5 years. They will continue to improve under the new system, especially where the landlord looks after his own land and takes care of the manures and fertilizes the land. (184.)

3. *Fertilizers*.—Mr. HARRISON says that in his section of South Carolina the cost of fertilizers is divided between landlord and tenant in the same proportion as the crop. In the lower part of the State the landlord furnishes the fertilizer. He does not think cotton can be raised in any section of the State without the use of fertilizers. The average amount of commercial fertilizer used on an acre of ground is about 200 pounds. If it is used every year the land will increase a little in value. The standard guano is worth \$18 a ton. Domestic fertilizer is also used. (112-114.)

4. *Crop-lien laws*.—Mr. FRISSELL testifies that what is known as the crop-lien system in the South grew out of the poverty of that section immediately following the war. Both the white and black men of the South were left with practically nothing. The white man had to mortgage his land to get provisions for the coming year; the negro had to give the land owner a mortgage on everything he possessed for provisions for himself, his family, and his stock. Under the lien system the tenant goes to a store, buys whatever his employer allows him to buy, and goes in debt for it. As a rule he is shiftless. High rates of interest are paid, and the debt increases from year to year. In addition to the high rate of interest which the tenant has to pay he is charged an immense profit on the goods which he buys. He gets very little money. Of course the man who loans money has to be secured, and inasmuch as he is dealing with a shiftless class of people he will necessarily charge a high rate of interest. It is difficult to borrow money in the South on land values. It has to be borrowed on crop securities. This situation obtains to a great extent in the cotton-raising belt. The idea at Hampton Institute is to change this condition and make the negro a small and owner. The students of Hampton are taught to avoid, as far as possible, the crop-lien system. (85, 86.)

Dr. DABNEY testifies that a good many of the commission merchants handle the business of loaning money and taking a mortgage on the crops in a legitimate way, and that no one blames the merchants for what grew out of the system. This crop-lien system is gradually dying out under the system of intensive farming and diversified crops, because the farmers now raise practically all their food products. Supplies are always very much higher when purchased on credit than when paid for in cash. In Alabama and Mississippi the tenant farmer under the crop-lien system was more completely a slave than he ever had been. Booker Washington and others are doing a great deal in getting the negroes to abandon this system of farming and raise their own food products. The more shiftless of the negroes who suffered from the crop-lien system became mere tenants, and some of them moved to other States. (182-184.)

Mr. HARRISON thinks the lien law of South Carolina has been beneficial to the poorer people of the State. The law has been greatly abused, but, whenever a man made the effort to rise, the lien law has been of some benefit to him. The young man who marries and rents a farm must have something in the shape of credit. He has no money and nothing except his labor. The lien law enables him to give a mortgage, as it were, upon his labor for his actual necessities. The law does not permit the mortgage in order to secure money borrowed for anything except what is absolutely necessary to make a crop. Any other debt has to be collected by the ordinary processes of the law. The lien law is becoming more and more obsolete every year. Ideas are changing and where people have not the capital to make the crops they usually go to the banks or to some individual. Banking facilities have greatly increased in recent years in South Carolina. The farmer goes to the bank when he needs money and pays the regular rate of interest, which, if no contract is made, is 7 per cent. Eight per cent may be collected under special contract. Where the tenant agrees to labor for one-half the crop, he has the option of receiving an advance from the landlord on the crop at a certain rate of interest, or he can go to the merchant or the bank and get money or supplies. Where he pays to the merchant or banker in kind the landlord must sign what is known as a quitclaim, because the law itself gives to the landlord a lien upon the tenant's crop for any supplies he may furnish that are necessary to produce the crop, and he would be the first man paid. (114.)

Professor Du Bois says that the crop-lien laws of Georgia ought to be changed, because they are now entirely in the interest of the merchants and give them such a grasp on the laborer as to put him in a state of economic slavery. If a man once gets in debt he can not leave the place without being arrested. These people are ignorant and their accounts are kept entirely by the storekeepers, so that the negroes have practically nothing to do with their crops. The merchants who have the crop liens spend most of their time riding around and watching the crop. When the crop is gathered it is taken to the warehouses and the warehousemen and the merchants make the settlements and pay the negroes what is left. The negro does not appear as a principal anywhere. It is of no use to try to get the negro not to raise cotton, because if he is in debt that is the only crop which the merchants will take in payment of the debt. The violation of the lien law is considered a misdemeanor, and can be punished by sending the violator to the chain gang. (167.)

Mr. MILLER says that nearly every planter who plants on shares or hires his labor has his commissary either in his house or in the store in town. The tenant or laborer seldom gets any money, because the landlord seldom has any, but he gets orders from the landlord for what he wants in the storeroom, and this order is secured by a lien on the crop. Most of the landlords themselves give liens in town for their supplies, and they subtilt them to the tenants.

Wherever a landlord has not capital enough of his own to run the land he signs away his right as landlord and the first lien on the crop to the merchant who supplies him. Then the merchant is paid first, and what is left the landlord gets next, and what is left after that is divided between the landlord and tenant.

B. Classification of negro tenants and laborers.—1. *Croppers.*—Professor Du Bois, describing the various social classes among the negroes in Dougherty County, Ga., says that, aside from recipients of charity, the croppers are the lowest class in the economic scale. The croppers are negroes who live on the plantations and are entirely without capital. They furnish the labor and the owner furnishes everything else, the cropper getting from one-third to one-half the crop. If the landlord has advanced supplies they are taken out of the cropper's share. The system is not very satisfactory either to the cropper or to the landlord and is being done away with. (162.)

2. *Metayers.*—Professor Du Bois testifies that under the metayer system in Georgia the landowner makes a contract with a laborer by which the laborer usually furnishes some capital—a mule, and some tools and something for subsistence. After the war the landowner looked out for the food and clothing of the laborer, but the storekeeper has now supplanted him in that capacity. Nine-tenths of the storekeepers in Dougherty County are Jewish merchants—some Russian and German Jews, but most of them Polish Jews. These men, with their ideas of thrift and of driving a hard bargain, do a great many things that other white men of the South would not do. They do not object to calling the negro "mister," are affable with him, and furnish the things he wants at prices ranging from 80 to 100 per cent above the cash price. The colored farmer usually pays his rent in cotton. For 20 acres and a house he would pay from 300 to 500 pounds of lint cotton. The average farmer has usually 40 acres (that is called a 1-mule farm) and the renter has from 350 to 2,000 pounds of cotton. Almost as soon as the crop is up, or sometimes before,

the metayer mortgages it to a merchant for advances. In this mortgage he usually stipulates that he will not claim the benefit of his homestead exemption, and very often the result is that he goes into bankruptcy, everything he has is sold out at auction by the merchant without any process of law, and the metayer goes back into the cropper class.

Fifty-nine farmers in Dougherty County who made from 1 to 5 bales of cotton paid 32 per cent of the product for rent; 18 farmers who made from 5 to 16 bales paid about 21 per cent as rent, and 21 farmers who made 16 bales and over paid about 16 per cent for rent. The rent paid by 161 farmers who made altogether over 1,000 bales in the year 1898 was 241 bales, or 22 per cent.

When the interest which the farmer has to pay on the goods he has bought is added to this rent, unless the season is a very good one, the farmer has nothing left. (162, 163.)

3. *Laborers working for a fixed wage.*—Professor Du Bois testifies that there are two classes of laborers working for a fixed wage in Dougherty County: (1) Those who receive houses and rations, consisting of meat and meal and a small wage of from \$4 to \$8 a month; these are usually called contract hands, and work through the season for the owner of the land; (2) the regular laborers who furnish their own houses and food, and receive on the average from 30 to 50 cents a day. These are usually young persons. (163.)

4. *Money renters.*—Professor Du Bois testifies that the fixed money rental calls for a good deal of foresight on the part of the farmer. He is required to furnish his own supplies, but can make a better contract and get better land if he can pay an actual sum of money, because the risk is very great. In 1898, of those in Dougherty County who paid money rent there were 191 who had farms under 40 acres, 8 between 40 and 50 acres, 5 between 50 and 100 acres, 1 from 100 to 150 acres, and 2 from 150 acres up. The average rent paid for farms under 40 acres is \$18.50; from 40 to 50 acres the average rent for a farm is \$41; from 50 to 100 acres it is \$72 a farm; from 100 to 150 acres it is \$100 a farm, and over that amount it is \$175 a farm. (163, 164.)

C. Particular crops.—1. *Cotton.*—Dr. DABNEY testifies that the acreage of cotton in the South was not affected at all by resolutions of any of the conventions that discussed the subject, but the acreage does not increase as rapidly as the increased price would seem to suggest. Cotton is grown more cheaply to-day than ever before. There are better implements, and the people know better how to cultivate and market it. It can be cultivated on a large plantation with great profit with hired help and by the use of machinery. The old theory in the South that one man with a mule could raise cotton more cheaply in a small lot than it could be cultivated on a large plantation has been exploded. Machinery has been applied to the culture of cotton with good results. The witness does not know of any crop, not even wheat in the Northwest, that can be cultivated on such a wholesale plan as cotton in the Brazos bottom land, where the cultivation is all done by machinery. The cotton seed is worth about one-third as much as the fiber and seems to be increasing in value from year to year. (183, 184.)

Mr. HARRISON says that the cost of making cotton is in the neighborhood of 5 cents a pound. Owing to the low price of the product in recent years farmers did not have anything left as profit, but since the advance in price cotton can be raised at a profit. Picking cotton is one of the greatest expenses in connection with the industry. Efforts have been made to invent a cotton-picking machine, but without success. The next most expensive item is hoeing cotton. Cotton is planted with a drill and comes up in a continuous row. The plant is very delicate and a great many more seeds need to be planted than are expected to grow. The hoeing or chopping out of the plants to reduce their number requires a great deal of work. A great deal of the work of picking cotton is done by the women and children. Perhaps nine-tenths of the labor in this industry is colored. (111-113.)

2. *Rice.*—Professor WRIGHT testifies that the rice industry in Georgia has been greatly neglected. Before the war South Carolina and Georgia yielded 170,000,000 pounds of rice. Now the entire yield in the United States is only 136,970,720 pounds, South Carolina and Georgia yielding only 26,638,720 pounds. This industry should be revived. Colored labor is the main dependence in the cultivation of rice. (202.)

3. *Fruit.*—Dr. DABNEY testifies that many portions of the South are excellent for raising almost all kinds of fruit. Peaches are grown at great profit, especially in Georgia. The people are learning to spray them and keep off the insects. They have found that it pays to cultivate the tree instead of permitting it to grow as best it can without cultivation. (184.)

4. *The sheep industry.*—Dr. DABNEY testifies that there has been a decline of the sheep industry in the South, largely because in many of the States there is no dog law. In Tennessee a few years ago the legislature passed a stringent dog law, and a

great many dogs were killed; but public sentiment was not educated on the question, and every member of that legislature failed to be returned. The witness thinks a reasonable dog law will be enacted in all the States in the not far distant future. Tennessee has fewer sheep than it had in 1860. Quite a good deal of the sheep business of the South is devoted to raising spring lambs for the Eastern market. This is quite an industry in southwestern Virginia. Mutton is being used in the Southern cities as an article of food. It is always on the market, but the people prefer beef and pork. At present the Southern people sell the lambs and make wool, and do not reserve much mutton for home consumption. (183.)

D. Particular localities.—1. *South Carolina.*—Mr. HARRISON says that at the close of the civil war, and perhaps up to about 1880, about three-fourths of the population of South Carolina, both white and colored, were engaged almost exclusively in agriculture. They had no money, and not much else except the land and mules and horses; but prices were high and agriculture was very profitable. After 1880 prices went down, and many of the people abandoned agriculture and went into other lines of business which seemed more promising. The agricultural population of the State has very much decreased in the last 20 years. There has been a greater decrease in the upper part of the State than in the lower part. Within the last 5 years nine-tenths of the agricultural population of the State would have quit the farm if they could, and many did quit whenever they had an opportunity of getting something better. (111.)

Mr. Harrison says that if a man will live on a bread-and-meat diet in South Carolina it will only cost him about 10 cents a day. There are farm hands who, with a house and wood furnished them, support themselves and their families on \$13 a month. (112.)

Mr. Harrison says there are 3 systems of farming in South Carolina. (1) Where the landlord hires and pays with a share of the crop, furnishing the land and everything except labor, the tenant is paid usually about one-half the crop; (2) where the tenant furnishes the stock he generally pays a rent of so many bales of cotton, which is about one-fourth, or 1,200 pounds, for a one-horse crop, the tenant furnishing everything excepting the land; (3) under the wage system the wages are usually from \$8 to \$13 a month in cash, the laborer getting the latter figure when he boards himself.

Under the tenant system the tenant invariably has a garden, a truck patch, a potato patch, and a watermelon patch, as the hired man also usually has. The hours of labor are usually from sun to sun. In the summer the rule is to begin about sunrise, stop 2 or 3 hours at dinner time, and then go on until night. Ten or 12 hours a day during the summer and from 6 to 8 during the winter are the usual hours of labor. (111, 112.)

Bishop SALTER says that the conditions of tenancy in South Carolina depend upon what the owner of the farm furnishes and what the tenant furnishes, but where the owner of the farm furnishes the land, the seed, the implements, and everything, the tenant gets one-third of the crop. (154.)

Mr. MILLER criticises the agricultural laws of South Carolina very severely. The law attempts to fasten the tenant to the landlord, and in the end drives the tenant away. The landlord can make a verbal statement, sustained by 2 witnesses, that the tenant has contracted to work for him that year, and if the tenant should leave and hire to some one else, the man hiring him can be arrested and made to pay a penalty; hence almost anything is better than a verbal contract on a farm. The lien law is violated, and great injustice is done under it in the little courts where it is administered. An enforcement of the lien law should be had in the courts of record of the State. The State of South Carolina ought to pass a law encouraging long leases. The lien not only covers the crop but all the chattels which the tenant owns. (123, 124.)

2. *The "wire-grass section" of Georgia.*—President WRIGHT confines his testimony principally to what he calls the "wire-grass section" of Georgia, comprising 32 counties extending across the State below the thirty-second parallel. This section has made great progress since the war, and every town has felt a rise of from 25 to 200 per cent in real-estate values. There is hardly a limit to the productive capacity of the soil and if capital can be enlisted the growth of the section will be phenomenal. There are vast possibilities of wealth in that section. The wire grass, which is not fit for hay, has recently been utilized in the manufacture of furniture, baskets, mattresses, matting, and coarse twine, and it is expected that it can be manufactured into rope. Labor in this section is practically all colored. The population is about equally divided between whites and blacks; the blacks, however, predominate a little. The population has greatly increased in the last 30 years. All of the negroes began work for small wages or part of the crops. Thirty per cent of them now are croppers or wage-earners, 60 per cent are tenants, and 10 per cent landowners. The wages for

the metayer mortgages it to a merchant for advances. In this mortgage he usually stipulates that he will not claim the benefit of his homestead exemption, and very often the result is that he goes into bankruptcy, everything he has is sold out at auction by the merchant without any process of law, and the metayer goes back into the cropper class.

Fifty-nine farmers in Dougherty County who made from 1 to 5 bales of cotton paid 32 per cent of the product for rent; 18 farmers who made from 5 to 16 bales paid about 21 per cent as rent, and 21 farmers who made 16 bales and over paid about 16 per cent for rent. The rent paid by 161 farmers who made altogether over 1,000 bales in the year 1898 was 241 bales, or 22 per cent.

When the interest which the farmer has to pay on the goods he has bought is added to this rent, unless the season is a very good one, the farmer has nothing left. (162, 163.)

3. *Laborers working for a fixed wage.*—Professor Du Bois testifies that there are two classes of laborers working for a fixed wage in Dougherty County: (1) Those who receive houses and rations, consisting of meat and meal and a small wage of from \$4 to \$8 a month; these are usually called contract hands, and work through the season for the owner of the land; (2) the regular laborers who furnish their own houses and food, and receive on the average from 30 to 50 cents a day. These are usually young persons. (163.)

4. *Money renters.*—Professor Du Bois testifies that the fixed money rental calls for a good deal of foresight on the part of the farmer. He is required to furnish his own supplies, but can make a better contract and get better land if he can pay an actual sum of money, because the risk is very great. In 1898, of those in Dougherty County who paid money rent there were 191 who had farms under 40 acres, 8 between 40 and 50 acres, 5 between 50 and 100 acres, 1 from 100 to 150 acres, and 2 from 150 acres up. The average rent paid for farms under 40 acres is \$18.50; from 40 to 50 acres the average rent for a farm is \$41; from 50 to 100 acres it is \$72 a farm; from 100 to 150 acres it is \$100 a farm, and over that amount it is \$175 a farm. (163, 164.)

C. Particular crops.—1. *Cotton.*—Dr. DABNEY testifies that the acreage of cotton in the South was not affected at all by resolutions of any of the conventions that discussed the subject, but the acreage does not increase as rapidly as the increased price would seem to suggest. Cotton is grown more cheaply to-day than ever before. There are better implements, and the people know better how to cultivate and market it. It can be cultivated on a large plantation with great profit with hired help and by the use of machinery. The old theory in the South that one man with a mule could raise cotton more cheaply in a small lot than it could be cultivated on a large plantation has been exploded. Machinery has been applied to the culture of cotton with good results. The witness does not know of any crop, not even wheat in the Northwest, that can be cultivated on such a wholesale plan as cotton in the Brazos bottom land, where the cultivation is all done by machinery. The cotton seed is worth about one-third as much as the fiber and seems to be increasing in value from year to year. (183, 184.)

Mr. HARRISON says that the cost of making cotton is in the neighborhood of 5 cents a pound. Owing to the low price of the product in recent years farmers did not have anything left as profit, but since the advance in price cotton can be raised at a profit. Picking cotton is one of the greatest expenses in connection with the industry. Efforts have been made to invent a cotton-picking machine, but without success. The next most expensive item is hoeing cotton. Cotton is planted with a drill and comes up in a continuous row. The plant is very delicate and a great many more seeds need to be planted than are expected to grow. The hoeing or chopping out of the plants to reduce their number requires a great deal of work. A great deal of the work of picking cotton is done by the women and children. Perhaps nine-tenths of the labor in this industry is colored. (111-113.)

2. *Rice.*—Professor WRIGHT testifies that the rice industry in Georgia has been greatly neglected. Before the war South Carolina and Georgia yielded 170,000,000 pounds of rice. Now the entire yield in the United States is only 136,970,720 pounds, South Carolina and Georgia yielding only 26,638,720 pounds. This industry should be revived. Colored labor is the main dependence in the cultivation of rice. (202.)

3. *Fruit.*—Dr. DABNEY testifies that many portions of the South are excellent for raising almost all kinds of fruit. Peaches are grown at great profit, especially in Georgia. The people are learning to spray them and keep off the insects. They have found that it pays to cultivate the tree instead of permitting it to grow as best it can without cultivation. (184.)

4. *The sheep industry.*—Dr. DABNEY testifies that there has been a decline of the sheep industry in the South, largely because in many of the States there is no dog law. In Tennessee a few years ago the legislature passed a stringent dog law, and a

not think that religious sentiment is spreading very much among the negroes. The influence of the education of negro ministers has resulted in the upbuilding of strict morals among the upper classes of colored people, but not in the spreading of religion. The colored parson of 20 years ago does not think much of the religion of the educated parson of to-day. The witness refers to the First Congregational Church of Atlanta, presided over by an educated minister whose sermons are often reported in the Atlanta Constitution, and says that it is a very fashionable church, but the older people have their doubts as to whether there is very much religion in it. Some of the white churches are practically the same way. (171, 172.)

4. *Beneficiary societies.*—Professor DuBois testifies that the church has not as strong a hold upon the congregation in Albany, Ga., as in some of the other Southern towns, but the beneficiary society wields an immense influence. Some of these beneficiary societies are like some of those in the latter part of the Roman Empire or the labor societies of the Middle Ages, being societies of men for mutual protection, for burying the dead, etc. These societies are increasing rapidly. The dues are ordinarily about 25 cents a month, and the money is chiefly used to bury the members of the society. Some of the societies are swindles. They are not secret societies, and the women and children sometimes join. These societies are distinct from the Odd Fellows and Masons, and some of them are very old, dating back to slavery days. (171.)

5. *Distribution of the population.*—Professor DuBois states that the distribution of the white and colored population in Southern towns is very interesting. Sometimes it is like a circle, with the white population in the center and the colored population forming a fringe around the edge. In Atlanta it is like a dumb-bell, with settlements here and there connected by a streak. In Albany, the county seat of Dougherty County, the town is divided almost exactly in two. The negro quarters of the town of Albany are well kept, and contain some pretty houses. There are no distinct slums, but there are some old and dilapidated houses of bad repute. There is an excess of negro women in all the towns, for the reason that negro women are employed as servants in most of the white families. (169.)

Dr. DABNEY does not believe there is any tendency on the part of the whites to move out of districts where an excess of negro population exists, simply because of the large number of negroes, but believes that any such migrations may be traced to other causes, and he refers to Prince Edward County, Va., which has been practically abandoned by the whites, not because it was so largely inhabited by negroes, but because of the infertility of the soil. Again, the negro is not subject to malaria as is the white man. (190.)

Mr. FRISSELL says the negroes are moving into communities by themselves very largely. There is a large part of the country of the South where whites can not live, but the blacks can; for instance, along the river bottoms where it is low and hot. The self-respecting blacks naturally move into communities by themselves, and thus avoid a great deal of the race feeling. In the course of time a great portion of the Southern States will be settled almost wholly by the blacks. The establishment of separate communities for whites and blacks ought to be taken cognizance of by the State, and, under proper regulations, will result in the betterment of both races. The negro in a separate community learns how to organize, and thus becomes more of a responsible citizen. There is no danger of perpetuating race prejudice by the separation of the races into different communities, but it is rather an advantage to both races. (87, 88, 90, 91.)

Professor DuBois testifies that most of the negroes in Albany, Ga., were not born in that town, but have drifted there because conditions are better in town than they are in the country. This migration movement is common to practically all the Southern country. There is very little chance for a negro who remains in the country. (169.)

6. *Intermarriage of the races.*—Dr. DABNEY does not think that the intermarriage of the negroes with the whites would be beneficial to either race. He thinks it would injure the negro and debase the whites. He refers to a book published some years ago which undertook to show that the negro race by intermarriage has degenerated in health, figure, morals, and so on. The witness thinks that the negro race is too far behind the white race for intermarriage. The mulatto women are not fruitful, and most of them have pulmonary troubles and are more delicate than either the blacks or the whites. The witness says that all the Southern States have practically prohibited the intermarriage of the whites and blacks, and that there is no tendency to repeal any of those statutes. Not only the old Southern element of the whites, but the Northern people as well who settle in the Southern country, all come to that point of view. (186, 187, 189.)

Bishop SALTER says there is no desire on the part of the negro race to intermarry with the whites, because there are three colors among the negroes: First, the pretty mulatto woman; second, the handsome Indian-looking woman, and third, the black woman. (153.)

7. *Present and past conditions compared.*—Mr. WINSTON, president of the North Carolina College of Agriculture and Mechanic Arts, thinks that up to 1860 three-fourths of the houses erected east of Raleigh, N. C., were erected by negro workmen. Mr. Winston's father owned two carpenters and other skilled laborers, one of whom could earn as much as \$2.50 a day, and he doubts if the children of any of these people have skill in any trade at all. The negro is better off generally than he was in slavery, but not as much better off as some people think. In slavery there were two classes, the better class comprising the most intelligent skilled workers and household servants. Now there are three classes: (1) The more intelligent ones, who are mainly professional men, barbers, etc.; (2) the great mass, and (3) the lowest class, composed of professional thieves, gamblers, and other criminals, idlers, loafers, etc., and also the infirm, decrepit, and semi-idiotic. Under the slave system the whole establishment was taken care of; under the present system the idle and vicious and weak are driven to the wall and into bad habits. The best class is rather larger than it was in slavery days; the lowest class did not exist in slavery, and is growing larger every day. (129.)

Bishop GAINES, of Atlanta, Ga., takes exception to above statement and expresses the opinion that at least two-thirds of the negroes have advanced materially since the war. At the close of the war only about 3 per cent of the colored people could read and write, while now probably 50 per cent of the race can read and write. The colored people in the cities who are compelled to live in alleys and back streets compare favorably with white people who live in similar circumstances. (142.)

Bishop SALTER also says two-thirds of the race have made rapid strides; the others possibly have not made the progress that they should. (153.)

Mr. FRISSELL, principal of the Hampton Normal and Industrial Institute, says that in some respects the colored man was better off in slavery than he is to-day. At present he has a chance to move if he can, but he can not. In slavery days his physical condition was looked out for, but now it is not. He is to a very great extent held in an irresponsible slavery. The wages of the negro are small, and so long as they are so they have an effect upon the wages of the white man. Many of the whites, as well as the negroes, are bound up by the store-lien system. Taking all the circumstances and surroundings into consideration, the race has made considerable progress. In certain parts of Virginia, however, there seems to be a retrograde movement; the negroes appear to be discouraged, and think that education has not brought them what was expected. (85, 89, 90.)

Bishop DERRICK, of Jackson, Miss., says the condition of the negro is a thousand times better to-day than when slavery existed, as is evidenced by the number of schoolhouses, homes, and churches for that race. No negro to-day occupies so low a place in the scale of civilization as he did when he was the property of somebody else. (158.)

President WRIGHT, of the Georgia State Industrial College (colored), expresses the opinion that the colored race has improved very greatly in the last 25 years in the matter of thrift and saving, and developed a great deal of perseverance in labor. (204, 205.)

Mr. Wright testifies that, for about 5 years following the close of the civil war and during the reconstruction of the States, the labor system in the South was practically paralyzed. The negroes who had been emancipated were in a very bad condition, with no money or property, and were very much under the influence of the carpetbaggers and their friends, who used them for their own selfish purposes. The condition of the white population was somewhat better, but was far from being at all satisfactory. From a report to the Secretary of the Treasury during the Administration of President Polk the witness finds that the cost of clothing and feeding a slave was \$30 per annum, and the slave owner made from \$100 to \$400 a year on each slave. The value of the slave property emancipated is estimated by the witness at \$3,000,000,000. The conditions growing out of the war brought about a political and industrial contest between the races which lasted for a number of years, but that has practically disappeared. The colored laborers of the South are not interested in politics, and have increased their wealth from year to year, until at present the negroes of Georgia own over \$14,000,000 worth of taxable property. A table is submitted showing the increase in various kinds of property owned by the negroes between 1886 and 1900. (199, 200.)

B. Industrial relations.—1. *Generally.*—Mr. HARRISON says that most of the farmers prefer the colored man for agricultural labor, because he is stouter, has been trained to that work for several generations, and is hard to beat either at hoeing or picking cotton. He generally has to have somebody to instruct him and to show him what to do. The white laborers are leaving the farm and going into the cotton mills, because they found with the depression of agriculture they could make more

money in the mills and factories than they could on the farm. It is not only the migratory or renter class among the whites that has gone into the mills, but some of the small farmers who own farms. The places of the white laborers on the farm have been taken by negroes. The colored people are also inclined to leave the farms and go to the towns to do odd jobs, and the result is that at present there is the greatest scarcity of agricultural labor that the State has ever known. There is not a man, woman, or child in South Carolina to-day who can not get work if he wants it. It frequently occurs that cotton is not picked out at Christmas. Immediately after Christmas preparations have to be made for another crop of cotton. Through the fall the small grain is put in and the cotton has to be picked. The result is that there is a demand for farm labor the entire year. Picking cotton lint costs about 1½ to 1¾ cents a pound. Seed cotton is cut down for about 40 or 50 cents a hundred pounds. Another reason why the white farmers have gone into the cotton mills is that some of the mills, especially the Piedmont and the Pelzer, have made liberal appropriations for schools, and some of them keep first-class graded schools for 8 or 10 months in the year. The condition of the agricultural class is not as good as it was 35 years ago, because at that time agricultural products were higher than they are now. Cotton sold as high as 18 to 20 cents a pound and corn as high as \$1 to \$1.50 a bushel. (113-116.)

One of the greatest drawbacks to the progress of the negro, in Mr. WINSTON's opinion, is his satisfaction with so little. What was originally looked upon as a "sorry quality of the negro"—that is, his fondness for good clothes and making a show—is the one thing which is doing the most at present for his improvement. The desire of negroes for good clothes is the greatest stimulus in making them labor beyond what is necessary for their mere existence. (127.)

2. *Occupations.*—Professor Du Bois, of Atlanta University, testifies that in Dougherty County, Ga., 96 per cent of the people are engaged in gainful occupations, being mostly farmers and laborers. Among the men 20 years old and over there are 1,319 farmers and farm laborers and only 179 in other occupations. Among the women there are 1,341 farmers and laborers and only 216 in other occupations. Between the ages of 10 and 20 the disproportion is even larger. Between the ages of 20 and 40 there are 696 farmers and farm laborers; 31 laborers in mills, cotton compresses, and on railroads, woodcutters, etc.; 12 are watchmen, porters, and teamsters; 8 are servants; 11 are artisans, carpenters, blacksmiths, shoemakers, machinists, and engineers; 6 are merchants and tailors, 3 are teachers, and 10 are ministers. (162.)

Professor Du Bois adds that of the men between 20 and 40 years of age the largest number in any single occupation are day laborers, receiving from 35 to 50 cents a day. Next in order are porters employed in stores, hotels, etc., some of whom do quite well. There are also a good many negroes employed in making fertilizers and in the cotton mills, and some on the railroads. The railroad laborers get quite good wages, and seem to be a fairly steady class. The trades are fairly well represented in Albany, Ga. There are 11 brick masons, 7 barbers, 7 painters, 1 baker, 1 tailor, 4 firemen, 1 wheelwright, 1 plumber, 1 mechanic, and 11 carpenters. All of the carpenter work is done by negroes, and they do it very well. The first colored doctor in the town has a horse and carriage and an office boy, and has quite a good practice. The other professional men are 6 preachers and 6 teachers. (170, 171.)

Bishop GRANT says that from reliable information he thinks about 40 per cent of the colored college graduates go into the professions of law, medicine, and theology. The others go onto the farms. In Texas there is a negro medical association, which is doing well. There are not very many young negroes at the bar. One reason for this is that there is a prejudice against the negro lawyer, and even the negro, if he has a difficult case in court, would hesitate to employ a negro lawyer. The negro doctors are doing better than the lawyers, and practically control all the practice in colored families. (151.)

Bishop GAINES takes exception to the following statement made before the commission by Mr. Pope Brown, president of the Agricultural Society of Georgia, in the volume on agriculture:

The presence of the negro is the special cause of the want of development of the South. His presence retarded the moral, religious, social, and agricultural development of that section, and if the negro were absent a better class of labor would take their places. The more the negro is educated the less efficient does he become as a laborer. Let the colored race be separated from the whites and colonized, either in this country or elsewhere, in the interest of the Southern States.

Bishop Gaines says Mr. Brown differs from the masses of the farmers of Georgia and from the general sentiment of the State, and cites the laws of Georgia forbidding emigration agents to come into that State and persuade colored people to leave. The State of Georgia recognizes the negroes as the best laborers in the South. They should be educated for agriculture. The diversity of farming can be brought about

only by an intelligent yeomanry. The white people are advocating the education of the colored people everywhere almost unanimously. The educated negroes are not criminals. (140.)

3. *In agriculture.*—Dr. DABNEY testifies that Booker Washington is doing a great work at Tuskegee Institute, and is educating the people on right lines. The patronage and support of the influential white people in the South is helping the negro in a business way. The witness thinks the South could not get along without the negro. He believes he is in the right place, and is going to stay there. He is improving, and, agriculturally, is the most important factor in the South. Immigrants from foreign countries can not stand the climate as well as the negroes, and are not any more willing to work than they are. The presence of the negro in the South prevents the poor white laborer from going into that section, because Germans and Swedes will not work with negroes. Italians sometimes do. (192.)

Professor WRIGHT testifies that although the colored man has had no teaching along the lines of agriculture and kindred branches of industry, he is twice as efficient as a free man as he was as a slave. The old slave negro laborer has proved a flat failure in freedom. Very few of that class have made a success, largely because they came out of slavery without any fixed or settled habits of labor. While perhaps a majority of the negro property owners were born before the war, they were very young at emancipation, and have spent most of their years as free men. (202.)

Bishop GRANT says there are rich men in most of the Southern States who employ colored labor because they can get it a little cheaper than white labor, and they have less difficulty in settling bills with the colored laborers. Living costs the white man more than the negro. The negro does practically all the agricultural labor of the South. Out of the 9,000,000 bales of cotton grown in a year, the negro raises at least 7,000,000, and practically the same proportion obtains in the matter of other Southern products, including rice, sugar, etc. (145-147.)

Bishop DEMERCK calls the negro the bone and sinew of the South, and says any attempt to encourage his emigration would be repulsed by the Southern people. An able-bodied negro is worth \$1,000 a year in the South, and his value is recognized. The negroes do all the agricultural labor, and often own their own homes. There are thousands of homes among the colored people of the South that would be creditable to any people. A large number own farms and live in the cities "like other gentry." Some have farms of as much as 1,200 acres. In some places there is hostility to negroes owning land, but it emanates very largely from competition and jealousy. "As long as the negro remains down there is no friction; when he starts up there is antagonism." (155.)

Dr. DABNEY testifies that according to the census of 1900 there are 7,000,000 negroes in the South. A few of them have become proprietors and employers of labor. Some of them own small farms, which they cultivate, but the great majority are laborers. Nine out of 10 of them are agriculturists. The failure of the negroes in cotton factories is due to the location of the factories at the towns and to the management, rather than to the negro himself. The city negroes do not make as reliable laborers as the country negroes. (184.)

President WRIGHT pleads for the improvement of negro farm labor, which comprises about 53 per cent of the farm labor of Georgia. The increase in the efficiency of labor, by raising the standard of intelligent farming, will be to the best interests of the country. The great drawback and discouragement of the colored farmer is a lack of working knowledge of the soil and of improved farming implements. There is little or no effort put forth to improve the colored farmer. No farmers' institutes are held among them, and little or no agricultural literature reaches them. The agricultural experiment stations are of practically no benefit to the negroes, because they are looked upon as having been instituted for the benefit of the white farmers only. Except those who are laborers upon farms of white planters, very few colored farmers know anything about improved farm machinery. The credit system, general extortion, the lawlessness of lynchers and white-cappers, the general laziness and shiftlessness of some of the negroes themselves, have resulted in many of the negroes becoming discouraged on the farm and leaving it for work in the cities and towns, where a little cash can be secured. The tenant system also tends to keep the farm laborer poor, ignorant, and lazy, and the cropper unambitious and unreliable. Ninety per cent of the farm labor of Georgia belongs to these two classes. The tenant system and the ignorance of the tenants cause them to be shiftless. (202.)

4. *In factories.*—Dr. DABNEY testifies that the South is providing for the whites as well as the blacks in industrial lines. In the southern Appalachian country and in North Carolina the cotton-mill operatives are the poor whites. The negroes, if they would work on the farms as they do in the mills, would do very well. What they need is leadership, like any other untrained race of people, and many of the whites are in the same condition. (191.)

Bishop **SALTER** says there is a cotton factory in his city in which all the employees are negroes, and they are doing very well and are giving excellent satisfaction. They operate the same kind of machinery as the whites, and the white foreman thinks they are better workmen than the poor whites, or "crackers." They work the same hours as the white men and under the same rules. (154.)

Mr. **MILLER** says there are many instances of negroes becoming competent as skilled factory laborers. In 1810 the two Carolinas, Georgia, and Virginia manufactured more and better goods of all kinds, including machinery, clothing, woolen and cotton goods, harness, etc., than all the New England States together, and the thing which drove the manufacturing institutions out of the South was slave labor. One of the best-paying cotton mills, established in 1847 or 1848, was the old Saluda factory, situated a few miles outside of the corporate limits of Columbia, S. C., which was managed by one white man, with some 98 to 120 negro hands under him. In most of the machine shops and government armories where arms were made in the South during the war the negroes predominated. They can be taught the mechanical arts as quickly as any other people, and they are the best labor that has ever existed. The natural resources of the South are unsurpassed. (120, 121.)

5. *In business.*—Replying to a question as to why the negroes do not go into mercantile business in the cities, Bishop **GRANT** says he thinks one reason is that there is lack of capital and lack of ability among the negroes for this kind of business. It requires generations to develop a business instinct. He instances one store in Ocala, Fla., owned and controlled by negroes, and employing negro clerks, which is one of the largest business houses in the city and is doing a successful business. Negroes sometimes engage in the banking business in the cities. Bishop **GRANT** believes it would be better, however, if more of them remained on the farms, and he thinks that there is enough rich land in the country for everybody to have a home and do well. (151, 152.)

6. *As a property owner.*—Bishop **GRANT** says the negro has advanced immensely since the days of slavery. In Texas negroes own \$80,000,000 worth of property, and in all the Southern States they own their own homes to a very great extent. There are some places in the South where the negroes own 40 miles of country. There has been great improvement in the houses, not only in the cities, but in the country districts, some of the houses having as many as 12 rooms. (146-148.)

Dr. **DABNEY** testifies that the negro is gradually becoming a landowner. There are quite a number of wealthy negroes in the South who have made their money since the war, and their number is increasing. (191.)

President **WRIGHT** testifies that the negroes in Georgia own 1,075,073 acres of farm land, nearly one-half of which, or 413,178 acres, lie in the "wire-grass section" of the State. Ten per cent of the negroes of the "wire-grass section" are landowners. (200.)

President **WRIGHT** says the negro farmer should be encouraged to own his own farm, and efforts should be put forth to make farm life attractive to him. For many years to come the negroes will be the chief and best labor for the South. (203.)

Bishop **DERRICK** says that in certain sections there is opposition to the colored people owning farms and homes, but that is not general. In the State of Alabama there is one colored planter who runs 50 places. (157.)

Professor **DU BOIS** testifies that there are 57 negro families who own land in Dougherty County, Ga. There have been 185 colored men who have owned land in that county since 1875, one of them owning his farm for 25 years. Some of them, however, have not owned their land more than a year or so. Their loss of the land was due both to lack of thrift and to the low price of cotton, and sometimes to their own carelessness and lack of legal knowledge. The negroes own 15,000 acres of land in the county, which is more than they have ever owned at any one time before. Since 1875 there have been 30,000 acres of land in the county owned by negroes. In 1875 they owned 752 acres; in 1880, 2,456 acres; in 1884, 6,607 acres, and this has increased from year to year. The total value of all negro property in the county is \$194,000. There is no particular objection to the negroes owning land on the part of the whites, except on the part of some of the poorer whites. There is very little chance for the negroes to become landowners unless they have unusual talents or have received some help, as they often have, from their former masters. Sometimes the children go to town and work as servants and help to buy land with their wages. More of those living in towns own land than of those living in the country. There are 7 or 8 negroes in the county worth \$3,000 or more. (164, 165, 170.)

7. *In labor organizations.*—Bishop **GRANT** says there is very little labor organization among the colored people. Except in rare instances, they are not permitted to join the white labor organizations. In Louisiana some years ago the Knights of Labor took some negroes into the organization, but this was so much resented that a bloody conflict occurred, in which about 35 negroes were killed. The negroes do not believe in

separate labor organizations, because such organizations would be against the interests of the rich and educated people of the South, who are the best friends the negro has. The white and colored mechanics do not work side by side except in isolated cases. The colored people develop as much skill in the mechanic arts as the average white man. (148.)

Professor Du Bois testifies that there are some colored labor organizations in the Southern cities, but there is very little affiliation between them and the white organizations. In most building trades the negroes can join, and considerable numbers have joined. They sometimes meet in the same hall, the whites on one side and the negroes on the other side. (175.)

Mr. WINSTON says that while some of the labor organizations that formerly excluded the negro from membership now accept him, and provide that no discrimination shall be practiced by their members against any member because of his creed, color, or nationality, those organizations are situated where there are very few negro laborers. (132.)

Dr. DABNEY says he has attended several conventions in the South where the question of organized labor was considered; that there is generally a prejudice in the South against organized labor, and that the negroes will be the great reserve force of that section in preventing labor organizations. The negroes are not developed sufficiently to be organized into labor unions, as are the whites. Of course, since the abolition of slavery the negro is developing very rapidly, and is becoming more and more capable of managing affairs and of organization. In the cities there is some little labor organization, but the white labor organizations are disposed to prevent the negroes from joining, and keep them out of the trades whenever possible. The prejudice against admitting the negro to membership does not extend to the small towns or to country districts. (188-190.)

C. Social and political conditions.—1. *Race prejudice.*—Mr. FRISSELL believes that there would be no political proscription against the negro if he were educated and capable. Where the graduates from Hampton have gone out and have land holdings and become a useful part of the community there are almost no complaints that they are not properly treated. The objection is not so much to the color of the negroes as it is to their ignorance. There is some rivalry between the two races in trades, but the South is such an undeveloped country that for many years to come there will not be any great danger of rivalry. As a rule where Northern capital has come into the South the negro has less chance than where he is employed by the Southern men, because the Southern man knows how to deal with him and the Northern man does not. It is quite noticeable that where Northern contractors and Northern laborers come in there is more push against the negro. To a limited extent the trades unions are composed of both races. In some places race prejudice is on the increase, but among the best element of the South there is no increase. One of the vital points is to have education for both races. Where there has been difficulty it has been because of ignorance on the part of both the whites and blacks. A certain element of Southern whites have no opportunity for education and are very emotional, and it is among them and the ignorant colored people that trouble arises. (89, 90, 92.)

Bishop DERRICK says race troubles in the South are common because the white man hates the negro. The feeling of the Anglo-Saxon is that the dark races must be subservient to him. Yet in certain sections of the South colored people who are upright, honest, and industrious are treated as fairly as any other class of people. (155, 156.)

Mr. WINSTON says that up to 1835 the negro in North Carolina enjoyed political rights. The real trouble between the whites and blacks has not yet begun; it will come up when the laboring white class will not want the negro to have an opportunity to labor; that is the race question in the world now. In New York City the white carpenters and brick masons and plasterers will not permit a negro to engage in these occupations. There are many counties in Texas where the negro is not permitted to live. The problem for the negro is to train himself and be able to do skilled labor before the hostility between him and the white man is so great that he will not be permitted to engage in these occupations. The white man is a better laborer than the negro in anything he undertakes. (131.)

Bishop GRANT believes that the white man is responsible for the conditions that exist in every Southern State, because the white race governs in those States. Strife between the races in certain sections reaches into the very households; but in no other country are crimes committed by the colored race as they are in the old slave States, nor is there any friction between the races excepting in those States. The agitation of politics among the negroes of the South after the war, by Northern men coming into that section, was detrimental. Those men are largely responsible for the

condition of the colored people to-day. The negroes are coming to think it to their best interest to keep out of politics. They have had trouble in the past because they voted along certain lines, and rather than have further troubles they have, to a large extent, refrained from voting. If protected by law they will reach the same results by voting that all other people in the country reach. The negro population of the United States is entitled to 49 votes in Congress, but as they do not receive this representation their interests are very often misrepresented.

The witness deprecates class legislation and discriminations against the negro because of his color; he says this class legislation in the Southern States would never have been enacted if the Supreme Court of the United States had not annulled the civil-rights bill. He believes the class legislation will eventually work to the detriment of the white race. (146-150.)

2. *Suffrage*.—Mr. WINSTON says the negro has been practically eliminated from political rights in the South for the same reason that the Chinese were in California and the Indians were in the West. It is a question of the superiority of races, and the whites never will consent to have their affairs administered by the colored race, no matter how much the colored race outnumbers them. The race question in the South is complicated by feelings engendered by the civil war between the white men in the North and South. The Chinaman is much superior to the negro, and yet he is not permitted to vote in California any more than the negro is in the South. One of the saddest things in history was the putting of the negro in a position in conflict with the white race and expecting him to maintain himself. The real friends of the negro desire to put him as soon as possible in a course of industrial training to make a living, get property, and be somebody, and get the idea out of his head that he is to hold office of some kind and manage the white race. (130-132.)

President WAGNER testifies that he is not opposed to an educational qualification for the right of suffrage. He thinks, however, it is a mistake at this late day to disfranchise the negroes unless the disfranchisement is to act only in the future. A qualification that deprives anybody of the ballot which he now possesses should be delicately considered, but a qualification meant as a help does no harm. The negroes of Georgia take very little interest in politics—much less, in fact, than is taken by the class of whites who are desiring to disfranchise them. An educational qualification might stimulate the negroes to obtain at least enough education to enable them to vote, and the result would be beneficial generally. (207, 209.)

Mr. WINSTON favors the constitutional amendment imposing an educational qualification for suffrage, pending in North Carolina (1899). The amendment applies to both races, but excepts from its operation until 1908 the descendants of such persons as could vote on the 1st of January, 1867. Speaking generally, the amendment will exclude illiterate blacks from now on, and will exclude illiterate whites from the suffrage beginning in 1908. (128.)

D. Education of the negro. (See also *Common Schools in the South*, p. xvii.)—

1. *Generally*.—Bishop DERRICK says illiteracy among the negroes is diminishing very rapidly. In 1860 practically the whole race was illiterate; in 1870, 90 per cent were illiterate; in 1880, 70 per cent; and now in some places it is reduced to 35 per cent. (158.)

Bishop GRANT thinks the industrial feature of education is becoming more prominent among the negroes than ever before, but says that in addition to industrial education there should be a development of the mind and the result would be the same as with any other class. The negro, living in a country where newspapers are giving information, can not be educated independently of public questions. Education is doing a great deal for the negro. It is improving his morals and his mind and making him a better citizen generally. (148-151.)

Mr. FRISSELL considers it very important that the negroes have public schools, and that they have the general direction of the whites in the way of government. Their salvation depends upon education and agricultural training, mechanical training, etc. The social and moral character of the negro improves very much by education. The history of the country, both North and South, will show that there is very much less crime committed by the educated than by the uneducated negroes, especially the greater crimes. (91.)

Bishop SALTER testifies that the education of the negro is bettering his condition and making him a most valuable citizen. The negro should have an industrial and a higher education. (152.)

Bishop GAINES says there is no compulsory education law in Georgia. In the rural districts the negroes have not the same opportunities to become informed that they have in the cities. In the rural districts there is not the same interest manifested in education as in the cities, for the reason that those districts do not have as much money for that purpose. (143.)

President WRIGHT thinks the negro farmer would be greatly helped by the plan of the Secretary of Agriculture in taking a number of young men and assigning them to the various scientific divisions of the Agricultural Department for study along the lines of the application of science to production. This is the only way the negro can get competent instruction, for there is now no place in Georgia where the negro youth can get proper training in the science of agriculture. There are very few colored men in the country who are capable of giving any instruction in the colored colleges or schools along these lines. (203.)

2. *Educational facilities in the South.*—Dr. HARRIS submits a table showing the increase of children in colored schools in the South for a number of years. In 1876 less than 600,000 negro children were enrolled in the South Atlantic and South Central States. The number has risen to 1,511,618. There are remarkable schools for the training of colored teachers, especially at Hampton, Va., Atlanta, Ga., Claflin University in South Carolina, and Fiske University at Nashville, Tenn. The aggregate amount paid from taxes for colored education in the Southern States during the past 26 years is about \$100,000,000. The increase in enrollment in colored schools has been in excess of the increase in population. The same is true of the enrollment of white children in the South. The amount of money expended for education of both races for the year 1899 in the Southern States is nearly \$33,000,000. The witness thinks that it is desirable to increase technical and manual training schools for the colored population of the South, but at the same time he would not disparage education in the ordinary branches. Language studies give an insight into human nature and make a government by public opinion possible. Mathematics and natural science are of great advantage. The total number of colored students in the high schools of the South is more than 15,000, and the total in colleges and institutions of higher education is over 43,000. Nearly 1,400 are learning farm work; nearly 1,500 are learning carpentry, and over 500 are learning blacksmithing, machine work, and work in metals. Over 600 are learning printing; nearly 8,000 are learning sewing, and over 2,200 are learning cooking. Industrial training should be encouraged in the South, not only in the colored but in the white schools, because the manufactures that are springing up in that section of the country need skilled labor, and there is a surplus on the farms which will be drawn into the mills. Inventions will be made which will reduce the hand labor on the farm and will cause a readjustment of vocations and an increase of labor in manufactures and commerce. (36-39.)

Bishop DERRICK says the negroes' morals have improved, and they are becoming more respected members of society. This condition is attributed to the schools and churches. There are one hundred and seventy-odd institutions of learning supported by the South, by the philanthropists of the North, and by the negro himself. Over 38,000 students are in the higher branches in colleges and seminaries. More than 1,000,000 are in the primary grades. The Southern States have paid out in the past 25 years over \$75,000,000 for negro education, which is an evidence of the public opinion and public policy of the South. (155.)

Bishop Derrick says Mississippi has given to the colored people a school at Alcorn supported by the State. Arkansas has one, at Pine Bluff, for boys. There are some agricultural colleges in Mississippi on a small scale. He supposes Mississippi supports the movement for the education of the negro, but it is to a limited extent. The witness has been informed that at Waco, Tex., there is to be a school built for negro youths, and other institutions of that kind are common in Texas. That State pays better salaries to the teachers of the negro children than any other State. (158.)

Mr. FRISSELL says that Booker Washington got the idea of starting Tuskegee from Hampton Institute, and made a practical reproduction of the parent school. At Lawrenceville, Va., a similar institution has been established by a colored man. At Calhoun, Ala., there is a sort of experiment station in farm work. These new schools are doing exceptionally well, especially the Tuskegee Institute, which has a plant worth from \$300,000 to \$400,000. If these schools are multiplied sufficiently, they will largely effect a solution of the negro problem. Literary education of the negro is not so essential as industrial education. There has been a tremendous change in the negro communities around the negro industrial schools, as at Tuskegee, for instance. When these colored institutes were first started in the South they were opposed by the colored race, who said that they were started with the idea that the colored people were incapable of anything higher than being hewers of wood and drawers of water; but that feeling has disappeared, and they are beginning to realize that their salvation does not lie so much in politics as in knowing how to do something. (84, 88-90.)

Dr. DABNEY testifies that there are more industrial training schools for the blacks than for the whites in the South, owing to the disposition of a good many Northern people and Southern people to become interested in the industrial education of the

black race. What is needed in the South is industrial education for the poor whites. (191.)

Bishop GAINES says that there are excellent schools in Georgia for the colored people. In Atlanta there are more colleges for the negroes than in any other city, with the possible exception of Nashville. A number of negro colleges in Atlanta are supported by churches and endowment funds. In the country throughout the State the school year is from 3 to 6 months. The colored schools employ colored teachers. There is cooperation on the part of the whites and negroes in Georgia in maintaining the facilities of education pretty generally in the cities. In some sections there is prejudice among the whites against negro education, but that sentiment does not prevail with the better classes. The schools of Georgia could be very much improved. They could give more time to education if there were more money at their disposal. The Atlanta colleges for the colored people rank about with the high schools in New England. The education there given the colored people is such as will fit them for general usefulness. They receive an industrial and a higher education as well, and the witness thinks that is the correct system of education. The industrial schools for the colored people in the South are very good, and are doing good. (141, 142.)

Bishop GRANT says there are about 170 excellent educational institutions in the South for the negro, in addition to the common schools provided by the States. About 30,000 young colored people will graduate in the next 2 years from these institutions of learning. (150.)

Mr. FRISSELL says the best public sentiment in the South favors the education of the negro. While a great deal has been said against their education, the fact remains that the South since the war has appropriated \$100,000,000 to educate the negroes. There are very few institutions in the South where the whites and blacks are educated together in the same school. The separate schools are maintained on very nearly the same basis, the black schools in some instances being better than the white, owing to the fact that they have received the help of Northern funds and thus have better-trained teachers than the white schools. As a rule the white school-houses are probably better than the colored schoolhouses, and the salaries of the teachers in the white schools are usually a little higher. The right sort of education will not spoil the negro laborers. What is required is an admixture of industrial education and book learning. Industrial education gives a common-sense knowledge and keeps the negro from getting what is ordinarily called the "big head." The fact that there are educated men and women of the colored race in the South has a tendency to inspire the colored people to learning and improvement of their condition. The public-school system, both for the white and colored people, has been a very great means of improving the whole community. There was quite a struggle on the part of some of the States to have taxation of the whites apply only to the white schools and that of the blacks to the black schools, but that practice has not prevailed to any extent. Of course there is still a turbulent element among the colored people of the South that education has not reached, and will not for many years. That portion of the community is worse off than it was in slavery. (88-90.)

Dr. DABNEY thinks there is no serious disposition on the part of any of the Southern States to curtail the education of the negro. There is some talk about it in the newspapers and some suggestions are made by politicians, especially in Georgia, who wish to proclaim some new doctrine which will give them notoriety. The South is feeling more and more the necessity of educating the negroes, and knows that they are necessary to the country. (195.)

President WRIGHT testifies that in Georgia the teachers in the colored schools are colored, and come largely from the South. Some of them come from the North, and some of them have attended various Northern schools. All who teach the higher branches are graduates of some school. There are a number of missionary schools and colleges giving a literary education for colored teachers. (204.)

Professor Du Bois testifies that for the white school of Albany, Ga., a special tax is levied on the white people of the town, and the school runs 8 or 9 months a year. The colored school runs about 4 months. The special tax for the white school is simply a private affair. If there is a white family that does not contribute, it will not be permitted to send its children to school. Professor Du Bois thinks the funds contributed for this white school are gathered largely by the regular tax gatherers. The public funds are not equally divided between the white and colored schools. The colored school gets perhaps one-third, and runs less time, has poorer teachers and poorer schoolhouses than the white school. The average colored child in Dougherty County can not get an education in the public school sufficient to enable him to read, write, and spell. (172, 173.)

While disclaiming special knowledge on the subject, Bishop GRANT expresses the opinion that there is no race discrimination in the distribution of the school

President WRIGHT thinks the negro farmer would be greatly helped by the plan of the Secretary of Agriculture in taking a number of young men and assigning them to the various scientific divisions of the Agricultural Department for study along the lines of the application of science to production. This is the only way the negro can get competent instruction, for there is now no place in Georgia where the negro youth can get proper training in the science of agriculture. There are very few colored men in the country who are capable of giving any instruction in the colored colleges or schools along these lines. (203.)

2. *Educational facilities in the South.*—Dr. HARRIS submits a table showing the increase of children in colored schools in the South for a number of years. In 1876 less than 600,000 negro children were enrolled in the South Atlantic and South Central States. The number has risen to 1,511,618. There are remarkable schools for the training of colored teachers, especially at Hampton, Va., Atlanta, Ga., Claflin University in South Carolina, and Fiske University at Nashville, Tenn. The aggregate amount paid from taxes for colored education in the Southern States during the past 26 years is about \$100,000,000. The increase in enrollment in colored schools has been in excess of the increase in population. The same is true of the enrollment of white children in the South. The amount of money expended for education of both races for the year 1899 in the Southern States is nearly \$33,000,000. The witness thinks that it is desirable to increase technical and manual training schools for the colored population of the South, but at the same time he would not disparage education in the ordinary branches. Language studies give an insight into human nature and make a government by public opinion possible. Mathematics and natural science are of great advantage. The total number of colored students in the high schools of the South is more than 15,000, and the total in colleges and institutions of higher education is over 43,000. Nearly 1,400 are learning farm work; nearly 1,500 are learning carpentry, and over 500 are learning blacksmithing, machine work, and work in metals. Over 600 are learning printing; nearly 8,000 are learning sewing, and over 2,200 are learning cooking. Industrial training should be encouraged in the South, not only in the colored but in the white schools, because the manufactures that are springing up in that section of the country need skilled labor, and there is a surplus on the farms which will be drawn into the mills. Inventions will be made which will reduce the hand labor on the farm and will cause a readjustment of vocations and an increase of labor in manufactures and commerce. (36-39.)

Bishop DERRICK says the negroes' morals have improved, and they are becoming more respected members of society. This condition is attributed to the schools and churches. There are one hundred and seventy-odd institutions of learning supported by the South, by the philanthropists of the North, and by the negro himself. Over 38,000 students are in the higher branches in colleges and seminaries. More than 1,000,000 are in the primary grades. The Southern States have paid out in the past 25 years over \$75,000,000 for negro education, which is an evidence of the public opinion and public policy of the South. (155.)

Bishop Derrick says Mississippi has given to the colored people a school at Alcorn supported by the State. Arkansas has one, at Pine Bluff, for boys. There are some agricultural colleges in Mississippi on a small scale. He supposes Mississippi supports the movement for the education of the negro, but it is to a limited extent. The witness has been informed that at Waco, Tex., there is to be a school built for negro youths, and other institutions of that kind are common in Texas. That State pays better salaries to the teachers of the negro children than any other State. (158.)

Mr. FRISSELL says that Booker Washington got the idea of starting Tuskegee from Hampton Institute, and made a practical reproduction of the parent school. At Lawrenceville, Va., a similar institution has been established by a colored man. At Calhoun, Ala., there is a sort of experiment station in farm work. These new schools are doing exceptionally well, especially the Tuskegee Institute, which has a plant worth from \$300,000 to \$400,000. If these schools are multiplied sufficiently, they will largely effect a solution of the negro problem. Literary education of the negro is not so essential as industrial education. There has been a tremendous change in the negro communities around the negro industrial schools, as at Tuskegee, for instance. When these colored institutes were first started in the South they were opposed by the colored race, who said that they were started with the idea that the colored people were incapable of anything higher than being hewers of wood and drawers of water; but that feeling has disappeared, and they are beginning to realize that their salvation does not lie so much in politics as in knowing how to do something. (84, 88-90.)

Dr. DABNEY testifies that there are more industrial training schools for the blacks than for the whites in the South, owing to the disposition of a good many Northern people and Southern people to become interested in the industrial education of the

crowd the cities, because he believes in agriculture. The witness received great encouragement from the inaugural address of the governor of Mississippi in which equal rights and opportunities were requested for the negro. (157.)

Bishop GAINES thinks if Congress could make a law to prevent the States from enacting class legislation it would be a good thing for the people. He opposes States' rights generally and thinks there should be an amendment to the Constitution making a State law null and void which discriminates against colored people. (144.)

3. *Suggested solutions.*—Mr. WINSTON says if something could be done to restore the friendly relations between the two races in the South, giving both races industrial education, it would do more for the negro than anything else that could be done. He believes, first, in the elimination of the great mass of the negroes from political life; and, secondly, in the demonstration by the negro that he is fitted for higher industrial education and can make himself useful and indispensable as a laborer. Whenever he shows that, he will have plenty of strong friends, and if he does not the antagonism which is growing up between the two races will continue. As a result of emancipation the negro has ceased to be influenced, either morally or otherwise, by the whites, as was the case in slavery days. The criminal class among the colored people is recruited largely from the younger generation. (129, 130.)

Mr. Winston says the real problem with the negro is to make a living, and he should seek industrial opportunity. He has found out that he has not and can not have any political chances, because he can not compete with the white race. The real struggle of the negro is to fit himself for the industrial fight that always exists, and he had better do so in this generation, for if he does not the white man will occupy the field and it will then be too late for him, "because he can not travel as fast as the white man." The negro should have embraced this opportunity when he was emancipated rather than have gone into politics. As between industrial education and the rudiments of literary education Mr. Winston favors the former for the negro, but believes it would be better if both could be combined. The State is too poor now to combine the two, and for that reason he favors industrial education for that race. Booker Washington is proceeding on right lines. (128, 129.)

Mr. Winston says amalgamation is not a solution of the negro problem. The last census showed nearly 1,000,000 people in the United States who were one-half white and the other half either negro, Indian, or something else; but the next generation will revert to negro instead of becoming whiter. The quadroon and the octoroon are either infertile with whites or their issue is sickly. (132.)

President WIGGINTON makes three recommendations for the betterment of the colored race: First, the duplication of experiment stations; second, national aid to education; third, and the most practical, would be that the Secretary of Agriculture should select some 5 or 6 colored youths from the various States and have them get the training that they can get, so that they might go back to the South and engage in that class of work themselves. (210.)

F. Negro slavery. 1. *As an industrial system.*—Dr. DABNEY controverts the generally accepted theory that negro slave labor as organized between 1800 and 1865 was a bad system industrially. He says that the common belief, even by those who have given the subject considerable study, that foreigners, such as the Italians and Hungarians, are better laborers than the negro is incorrect. Uneducated, untrained laborers can not be compared with educated, skilled laborers. Both Northern and Southern contractors always prefer negroes to the Italians or even to the poorer Irish for practically all kinds of labor. Dr. Dabney says slave labor as organized in the Southern States was economically one of the most efficient and productive labor systems ever applied to agriculture. He makes comparison between the results of slave labor in the Southern States and of free labor in the Northwestern States, from Ohio to Kansas and Minnesota, treating of the assessed values of the respective sections, the value of their leading agricultural productions, domestic animals, and the earnings of their people and finds the South before the war superior. Thus the annual earnings of the free States, including all the branches of agriculture, mining, manufactures, and live stock in 1850 were only \$98.67 per head, while in the same year the same industries in the slave States yielded \$108.35, including the slaves, or a difference of 10 per cent in favor of the slave States. By the same calculation the witness finds that in 1860 there was a difference of 16 per cent in favor of the slave States, and he says that in almost every line of production based upon agriculture the slave States were producing more than the Northwestern States with free labor. These facts, he says, can not be explained, except upon the theory that African slave labor as organized at that time was highly productive. The poor whites of the South, as is well known, contributed comparatively little to the production of those States, and the negro must be given credit for these general agricultural results.

President WRIGHT thinks the negro farmer would be greatly helped by the plan of the Secretary of Agriculture in taking a number of young men and assigning them to the various scientific divisions of the Agricultural Department for study along the lines of the application of science to production. This is the only way the negro can get competent instruction, for there is now no place in Georgia where the negro youth can get proper training in the science of agriculture. There are very few colored men in the country who are capable of giving any instruction in the colored colleges or schools along these lines. (203.)

2. *Educational facilities in the South.*—Dr. HARRIS submits a table showing the increase of children in colored schools in the South for a number of years. In 1876 less than 600,000 negro children were enrolled in the South Atlantic and South Central States. The number has risen to 1,511,618. There are remarkable schools for the training of colored teachers, especially at Hampton, Va., Atlanta, Ga., Claflin University in South Carolina, and Fiske University at Nashville, Tenn. The aggregate amount paid from taxes for colored education in the Southern States during the past 26 years is about \$100,000,000. The increase in enrollment in colored schools has been in excess of the increase in population. The same is true of the enrollment of white children in the South. The amount of money expended for education of both races for the year 1899 in the Southern States is nearly \$33,000,000. The witness thinks that it is desirable to increase technical and manual training schools for the colored population of the South, but at the same time he would not disparage education in the ordinary branches. Language studies give an insight into human nature and make a government by public opinion possible. Mathematics and natural science are of great advantage. The total number of colored students in the high schools of the South is more than 15,000, and the total in colleges and institutions of higher education is over 43,000. Nearly 1,400 are learning farm work; nearly 1,500 are learning carpentry, and over 500 are learning blacksmithing, machine work, and work in metals. Over 600 are learning printing; nearly 8,000 are learning sewing, and over 2,200 are learning cooking. Industrial training should be encouraged in the South, not only in the colored but in the white schools, because the manufactures that are springing up in that section of the country need skilled labor, and there is a surplus on the farms which will be drawn into the mills. Inventions will be made which will reduce the hand labor on the farm and will cause a readjustment of vocations and an increase of labor in manufactures and commerce. (36-39.)

Bishop DERRICK says the negroes' morals have improved, and they are becoming more respected members of society. This condition is attributed to the schools and churches. There are one hundred and seventy-odd institutions of learning supported by the South, by the philanthropists of the North, and by the negro himself. Over 38,000 students are in the higher branches in colleges and seminaries. More than 1,000,000 are in the primary grades. The Southern States have paid out in the past 25 years over \$75,000,000 for negro education, which is an evidence of the public opinion and public policy of the South. (155.)

Bishop Derrick says Mississippi has given to the colored people a school at Alcorn supported by the State. Arkansas has one, at Pine Bluff, for boys. There are some agricultural colleges in Mississippi on a small scale. He supposes Mississippi supports the movement for the education of the negro, but it is to a limited extent. The witness has been informed that at Waco, Tex., there is to be a school built for negro youths, and other institutions of that kind are common in Texas. That State pays better salaries to the teachers of the negro children than any other State. (158.)

Mr. FRISSELL says that Booker Washington got the idea of starting Tuskegee from Hampton Institute, and made a practical reproduction of the parent school. At Lawrenceville, Va., a similar institution has been established by a colored man. At Calhoun, Ala., there is a sort of experiment station in farm work. These new schools are doing exceptionally well, especially the Tuskegee Institute, which has a plant worth from \$300,000 to \$400,000. If these schools are multiplied sufficiently, they will largely effect a solution of the negro problem. Literary education of the negro is not so essential as industrial education. There has been a tremendous change in the negro communities around the negro industrial schools, as at Tuskegee, for instance. When these colored institutes were first started in the South they were opposed by the colored race, who said that they were started with the idea that the colored people were incapable of anything higher than being hewers of wood and drawers of water; but that feeling has disappeared, and they are beginning to realize that their salvation does not lie so much in politics as in knowing how to do something. (84, 88-90.)

Dr. DABNEY testifies that there are more industrial training schools for the blacks than for the whites in the South, owing to the disposition of a good many Northern people and Southern people to become interested in the industrial education of the

awhile—say from 1 to 6 years—and then leaving her and getting another wife. Sometimes there is no regular marriage ceremony performed, but the cohabitation is practically permanent, being in effect a common-law marriage. About 8 per cent of the families through the country districts occupy this social status, and the effect generally is to show a large number of widows in the statistics, though the proportion of widows is not so great as among the colored population in Philadelphia that have come up from the South. About 10 per cent of these negroes were born in the county and about 90 per cent of them were born in the State of Georgia. The others came from the border States and Virginia. This part of Georgia was greatly affected by the internal slave trade. In the fifties they supplied negroes for the rich cotton lands of Dougherty and adjacent counties. (159-161.)

Professor Du Bois testifies that about one-half of 1 per cent of the population of Dougherty County are recipients of charity, being mostly old people living in the country in houses furnished them rent free. They work a little, but are practically supported by charity. Next above these come the croppers, who are about 10 per cent of the population. He puts these two classes together and calls them the "submerged tenth." Next come the great mass of laborers, who work on the share system and are called "metayers." These number 39 per cent. Then come the wage laborers, who work for a fixed money wage. These number 21 per cent. Then there are the wage laborers who have houses furnished to them and number 18 per cent. Above these are the renters, who are 4.6 per cent, and property owners, numbering 5.7 per cent.

In the first grade of people in Dougherty County, corresponding to the ordinary middle class of people in New England, there are found good, honest people, without any trace of immorality, who are getting along well. In the second grade the witness puts the people who usually do not own their homes, but who are honest and upright. In the third grade he puts all the laborers who have no criminal tendencies and are not distinctly immoral. He puts all the others in a fourth class. The first class contains 3 per cent of the population; the second, $5\frac{1}{2}$ per cent; the third, 83 per cent; and the fourth, $8\frac{1}{2}$ per cent. There has been very little tendency to race troubles in that part of the State. There never has been a riot or a lynching, and there is very little crime. Out of 300 tenant families from whom he obtained a statement of their financial affairs for 1898, which was a bad year, he says 168 ended the year in debt, 53 came out about even, and the rest cleared from \$10 to \$50 for the year. (162, 166.)

Professor Du Bois testifies that 761 negro families in Dougherty County live in 1-room cabins, 560 in 2-room cabins, 93 in 3-room cabins, and 60 in cabins having 4 rooms or more. If it were not for the fact that the negroes live out of doors most of the time, they would be more crowded than in the tenement districts of New York. There are over 25 persons for every 10 rooms of house accommodation. These cabins are very bad, have only a hole in the wall for a window, usually a plank floor, but sometimes dirt; and the 2-room cabin is not twice as good as the 1-room cabin, because the additional room is very often a little "lean-to" in the back, or sometimes a loft which is only half a room. They are not kept clean, because all the women work out in the fields as well as the men, and have no time to keep things clean. They use fireplaces, and do not know how to use a stove. There is usually a chimney to the cabin, but sometimes it is an old clay or wood chimney. The furniture consists of two beds, which almost always look dirty, and there is a large chest with a lid to it, and a few chairs. In the better class of houses more furniture is found. The staple articles of food are bacon and corn meal, and some coffee and molasses. (165, 166.)

Professor WRIGHT testifies that there are 26,000 negro polls in the "wire-grass region" of Georgia, which pay \$1 poll tax, and they own property worth \$3,063,896. This property is taxed at the rate of 5.2 mills and yields \$15,932.25. The negroes of this section, however, only receive an expenditure for police protection and education of \$12,328.16, and their schools run from 3 to 5 months in a year. (201.)

2. *The negro on the sea isles.*—Bishop SALTER says he does not think the negroes on the sea isles have deteriorated. Some of them own their homes and their live stock. They speak the English language as well as the white men on those islands. "Put on a dark veil and you can not tell the white man from the negro, as far as his brogue is concerned, on these islands." The negro on the islands is willing to work, and does work faithfully when the opportunities are given him. He is paid for his labor ordinarily in tickets, good at the plantation stores. It would be a great improvement if he were paid in money. If a planter owes a negro \$1, he pays him 75 cents in checks and maybe 25 cents in money. He does not know whether this method of payment is recognized by the laws of South Carolina. It is substantially the same system of

payment as prevails in the mining States—Pennsylvania—for instance, where there are "company stores," and the miners are compelled to buy at them. (153, 154.)

3. *The negro and the Indian compared*.—Mr. FRISSELL thinks the negro was very much better fitted by slavery for the reception of civilization than the Indian was on the reservation. Slavery taught the negro three things—first, a knowledge of the English language; second, some regular habits of industry, and third, something of the Christian religion. The Indian on the reservation was not permitted to come in contact with the white men, and the result was that he was kept in barbarism, so that when an Indian and a negro were put side by side the negro was better fitted for civilization than the Indian. The capacity of the Indian is not lacking, but the conditions surrounding him were not favorable. (88.)

4. *Color of negroes*.—Professor DuBois testifies that in Dougherty County, Ga., 63 per cent of the negroes are black and 33 per cent are brown. It is not possible to tell whether all the brown population are of mixed blood, because sometimes full-blooded negroes have a brownish or yellowish color. In the towns about 60 per cent are black, 32 per cent brown, and the remainder yellow. (169.)

5. *Slave pensions*.—President WRIGHT does not advocate pensioning the old negroes who were in slavery, or the paying of their old masters for their loss. (203.)

Bishop GAINES says that in certain parts of the South designing men go among the ignorant negroes and lead them to believe that they can secure the passage of a slave pension law, and get them to organize societies to further such legislation. He says that the individual members of his church have sought to enlighten the people on this matter and warn them against these designing men. (144.)

6. *Atlanta University studies*.—Professor DuBois testifies that Atlanta University has issued 4 publications relating to the negroes: (1) "Mortality of negroes in cities." (2) "Social and physical conditions of the negro" of several cities. Different cities were selected for this publication and some typical districts in each city. Graduates of the university and other institutions went through those districts and wrote their impressions. (3) "Efforts of American negroes for social betterment." This included all sorts of institutions, church work, etc. (4) "The negro in business." (168, 169.)

7. *Convicts in the "wire grass section" of Georgia*.—President WRIGHT testifies that, according to the report of the keeper of the penitentiary, there are only 673 negro State prisoners from the "wire grass section" of Georgia, out of a population of more than 166,000, and he argues that this shows rather a good moral condition. These prisoners are employed in the turpentine industry, on farms, in getting out cross-ties, and on public roads. Their employment in this work not only tends to lower the standard of living in that country, but lowers the morals and efficiency of labor in the neighborhood. (201.)

8. *Arrests in Dougherty County, Ga.*—Professor Du Bois says that from April 1, 1898, to April 1, 1899, there were 191 arrests in Dougherty County, Ga., practically all of which were colored. Of these, 44 were released on bond, 42 were found not guilty, 17 went to the chain gang, 16 were fined, and 5 cases settled out of court. The most serious offenses charged were 28 burglaries, 16 assaults to murder, and 1 assault to rape. (167.)

9. *Need of reformatories in the South*.—Bishop DERRICK says that the South needs boys' reformatories for juvenile offenders, who are now sent to prisons and penitentiaries, where they are brought in contact with inveterate criminals, and, instead of being reformed, are worse when turned out than they were before. Nothing of that sort exists in the South, and the result is that this system is breeding criminals. (157.)

VIII. MISCELLANEOUS TOPICS.

A. Industrial problems.—1. *Labor and capital*.—Dr. HARRIS thinks that the working class, as it becomes educated, will know its rights and privileges as members of the community, and that more discontent will be created and more irritation grow up between capital and labor. The hatred of capital which prevails among many individuals is due to the fact that capital has not undertaken the political education of the laboring class. If capital would show how its employment in the community for the promotion of manufactures and commerce cheapens the cost of the necessities and the luxuries to all consumers; that it makes the employment of the wage-earner more constant; that the invention of machinery increases the amount of production that can be purchased by the consumers and produces many other advantages, a more healthful opinion would come to exist in the minds of the workers. "Capital owes it to itself to make its usefulness to the whole people as plain as a lesson in elementary arithmetic." Capital in making its combinations often becomes

careless of the condition of the workingman, and flatters itself that it may ignore the public opinion of that class. This is very much to its detriment. (46-47.)

2. *Combination and prices.*—Dr. HARRIS says that the more the middleman can be eliminated in commerce the more the producer gets for his raw material, the manufacturer for his labor, and the less the consumer has to pay for the article in its final shape. A department store by combining various lines of commerce is able to perform 10 times as many exchanges as can be performed by separate stores using the same number of clerks. The raw material increases in value as it nears the central market, while the manufactured product decreases in price. At London, the central market of the world, manufactured products are the cheapest, and raw materials are the highest in price. In the great centers of population, like London, Paris, and New York, the poor people pay from 400 to 600 per cent more than they ordinarily would pay for the necessities of life if they were nearer the producing point. They buy in small retail markets and pay the profits of a long series of middlemen, while their rich neighbors buy nearer at wholesale prices, and pay much less for what they get.

3. *Classification of occupations.*—Dr. HARRIS says the census divides all gainful occupations into 5 classes: (1) Agriculture, fishing, and mining; (2) professional; (3) domestic and personal; (4) trade and transportation; (5) manufacturing and mechanical. In the beginning the first of these classes would absorb nearly the entire population, but as population increases and civilization advances the division of labor comes, and with it the rapid development of skill and the invention of machines to perform simple occupations. Afterwards more complex machinery is invented. Increase of productive power renders many laborers superfluous in the lower order of production, and a gradual readjustment begins by transfer from agriculture to manufacturing, transportation, and professional occupations. Statistics are given for the years 1870, 1880, and 1890, showing a decrease in agricultural laborers per 1,000 of population and an increase in professional, manufacturing, and other industries for the same periods. Greater comfort to the workingman is produced by the portion of labor that is expended on transportation. An increase of the employees engaged in this business from 1870 to 1890 is shown by figures taken from the census to have been nearly 16,000 in each million of inhabitants. A similar movement in the handling of metals is noted, from the lower order of work to specializing in new trades and increasing skill. Formerly the blacksmith performed nearly all the work in iron and steel. Blacksmiths have relatively decreased, while the various trades that are doing specialized iron and steel work have progressively increased. Figures are given in support of this statement from the census reports of 1870, 1880, and 1890. By the application of machinery the labor of the hands is multiplied from 10 to 1,000-fold. New inventions in the way of iron and steel manufacture nearly keep pace with the expansion of trade in iron and steel products, hence the transfer of laborers from agriculture to this branch of manufacture is slow, there being only a 21 per cent increase from 1870 to 1890. Other branches of industry have shown a similar development. Machinery increases the production and hastens the division of labor. The census reports show an increase of 50 per cent between 1870 and 1890 in the manufacture of clothing as a special occupation. This increase came from the laboring classes that had been engaged in the production of necessities. The still more numerous class connected with trade and commerce shows a large increase from decade to decade. In the present age the most advanced people in nature studies are the ones who lead in the discovery of inventions. With the invention of machinery the hand laborer loses his place, and the more intelligent laborer, who can direct a machine, is employed. Germany is a nation distinguished for the invention and employment of useful machinery. France and Belgium excel in making ornaments. British industry is constantly undergoing transformation by the substitution of more effective machinery for that in use, and by the substitution of machines for what had formerly been done by hand. In Great Britain the workmen that are thrown out of employment by the introduction of machinery are provided for in almshouses. The population which lives in almshouses varies from 1,500,000 down to 400,000. This phenomenon is not much observed in the United States for two reasons: (1) Because the great production of raw materials of food and clothing in the United States does much to make pauperism unnecessary; and (2) the general education of the people in elementary schools makes the laborer more versatile and he takes more readily to the direction of machinery. The school education causes aspirations in the laborer and makes him uneasy and restless, with the result that he is goaded on toward a higher plane of production. (13-16.)

Dr. Harris classifies occupations as follows:

List of occupations.

- I. The lower order—production of necessities.
 1. Procuring of raw materials.
 - (a) Agriculture and grazing.
 - (b) Hunting, fishing.
 - (c) Mining (including petroleum wells, etc.).
 2. Transportation.
 3. Transformation of products.
- II. The higher order—production of means of luxury, of protection, and of culture.

The vocations that provide:

 1. Means of luxury and creature comfort, including manufactures that require a higher order of educated technical skill.
 2. Means of protection, including—
 - (a) Those who provide amusement and recreation.
 - (b) Medical profession.
 - (c) The legal profession.
 - (d) Officials managing public works or public charities, also Government officials.
 - (e) Insurance companies and the directive agents of companies formed for guarding the interests, general or special, of society as a whole, or of any particular part of it—charitable associations, trade unions, etc.
 2. Instrumentalities of culture.
 - (a) Moral and religious—churches, etc.
 - (b) Intellectual and moral education—schools and libraries.
 - (c) Esthetic.
 - (d) The collection and diffusion of information, editing and printing of books and newspapers, telegraph operators, etc.
 - (e) Pursuit of science and the invention of devices useful in the arts.

(58.)

4. *Production and governmental policy.*—Dr. HARRIS says that a population entirely engaged in agriculture may greatly increase its production by transferring a portion of its agriculturists to the work of manufacture and commerce. A home market for the products of agriculture increases the amount of money paid to the producer. According to the census of 1890, Massachusetts earned between 3 and 4 cents per day for each inhabitant by agriculture, and nearly 51 cents a day by its manufactured products and commerce. The value of its mining products is only one-half of a cent a day. The farm products of South Carolina amounted to 12½ cents a day for each inhabitant, but the manufacturing products amounted to only 3 cents a day and the mining products to less than 1 cent a day. He thinks it likely that an increase of manufactured products in South Carolina would have raised the value of the agricultural products by increasing home consumption. There is a continual increase in the amount produced by the individual when the community gains a supply of machinery. The United States with 20,000,000 horsepower of steam engines immensely increases its annual production per inhabitant. The era of machinery has just begun. In time the majority of work on the farm that is now done by hand labor will be done by machinery. Italy, a marvelously fertile country, does not raise enough agricultural products to furnish large average incomes for its people because it has little steam power and few manufactories. In Great Britain 30 families out of every 100 receive \$1,000 or more income per annum, while in Italy only 3 families out of every 100 receive that amount. (33.)

Dr. Harris says that it is possible in a community to furnish more raw material than is needed for that community, and when this is the case labor should be transferred from the production of raw material to its manufacture and exchange.

Mr. BEATY says that the natural advantages of any section ought to be recognized whether the climate is advantageous or otherwise. The Alabama industries, for instance, owing to their proximity to the coal fields, have an advantage over like industries located away from the coal fields, and Alabama ought to receive the benefit of her natural advantages. (100.)

Mr. HARRISON believes that all the products of America should be manufactured in America. Cotton should be manufactured in the United States, and corn or wheat should also be put into a manufactured state. The time has passed when one part of the Union ought to be in competition with another. If a manufacturer in South Carolina can make more money than one in Massachusetts, the true policy would be for the Massachusetts man to move to South Carolina. He would still be an American, and he ought to go wherever he can make the most money. The witness thinks America is on a wave of prosperity. He is an antiexpansionist, but at the same time thinks the market for our manufactured stuffs ought to be extended. "We ought to quit producing raw material for some one else to manufacture." (116, 117.)

5. *Steam power and labor-saving machinery.*—Dr. HARRIS says that, according to Mulhall's tables, steam power increased in the United States from 3¼ millions in 1860 to 17 millions horsepower in 1895; in Great Britain and Ireland, from 2¼ to 13 millions horsepower; Germany, from seven-eighths of a million to 7¾ millions horsepower; France, from 1¼ to 5 millions horsepower. Italy, Spain, Austria, and Russia

have not yet become great users of steam and their productive power per inhabitant is less than in the other countries mentioned. Italy had only $1\frac{1}{2}$ million horsepower in 1895; Spain, $1\frac{1}{2}$ million; Austria, $2\frac{1}{2}$ millions, and Russia, $2\frac{1}{2}$ millions. A table is submitted showing the increase of the daily earnings per inhabitant, according to Mulhall, of the countries mentioned. The witness says that it is possible that the production of each inhabitant in England is a little more than in the United States at present, if consideration is given to the English capital invested in manufacturing and transportation in other countries. He does not think that the production of each individual in the United States was more than 10 cents in 1800, because there was so little machinery in existence and the cost of human labor was so great to market what was produced. Transportation at that time cost more than the produce would bring when brought to market. The introduction of machinery has increased the productive power of each laborer in all lines of business, especially in agriculture, so that wages in agriculture have increased and many of those engaged in agriculture have gone out into other employments. The period from 1880 to 1890 was the most prosperous 10 years in the history of the United States. The number who left agriculture and found employment in manufacturing and commerce between 1870 and 1890 amounted to 20 per cent of the farming population. In 1870 the agricultural population amounted to 50 per cent of the whole people, while in 1890 only 40 per cent were engaged in farming. (12, 13.)

Dr. Harris testifies that labor-saving machinery has cheapened the cost of practically all the articles of food and clothing for the workingman except the cost of meat, which has gradually increased. This item has increased because for the past 300 years its consumption has greatly increased. The great staple grains, measured by a day's wages, have not increased, and many other articles of food have decreased in price, especially tropical fruits. The amount received per day by each laborer in manufactures is much higher in the day shortened to 10 or 11 hours than it was in the day of 14 hours. (48.)

Professor ROBERTS calls attention to the fact that one man by the use of horsepower and labor-saving implements is able to produce from 4 to 10 times as much as one man could in the early days. Corn is raised entirely without the use of the hoe; formerly it was planted with the hoe and hoed from 3 to 5 times during the season. Formerly 1 or 2 horses and oxen were used to till the soil; now it is not uncommon to see 5 or 6 horses drawing a gang plow. One horse is equal to about 10 men in tilling the soil, and the cost of its labor is about half that of a man, so that each additional horse that can be used to advantage multiplies the working power of the man from 10 to 20 times. Economy in the use of machinery and horses is best illustrated in the harvest fields of the great wheat districts, where from 26 to 30 animals are not infrequently hitched to a machine which cuts, thrashes, and cleans from 2,000 to 4,000 bushels of wheat a day, requiring only 3 or 4 men to operate it. (242.)

Professor Roberts says the manual labor of the farm has been so economized by the use of machinery—horsepower, etc.—that only about one-fourth to one-tenth as many men are required to produce a given amount of food and clothing as formerly, and this is the great reason for the tendency of the boy to leave the farm for the city. (242.)

6. *Children in industrial establishments.*—Mr. BEATY says that, in his opinion, a youth should not enter a manufacturing establishment to earn his own living at less than 12 years of age. Under some conditions a good, energetic fellow can apply himself at night and educate himself, in addition to the work he does during the day. The employment of children at this age does not deprive any adult of employment. There is employment for everybody in the South to-day in the cotton-mills. In the spinning room of the mills the work is done almost exclusively by children. Climate has a good deal to do with the development of children. In the Southern States a child would mature earlier than in the Northern States. Perhaps 14 years might be the proper age for children in Massachusetts to begin work in the mills. (100.)

Mr. HARRISON does not think children ought to be put into the mills or factories until they have received a fair education, say at about 15 years of age. There are special cases, however, where there is a widow left with a number of children and no other support, in which he thinks it would be better to allow the children to go into the mills at an earlier age. He does not believe that this matter can be regulated by law, but that it is best to leave it as it is. (116.)

8. *Railways.*—Mr. HARRISON thinks that transportation has a great deal to do with the progress of the country. In the part of South Carolina where he lives there are no water facilities. The railroads can make or unmake any town they want to by discriminating rates. For instance, the freight on corn from the corn-producing States to South Carolina would be more than the price of the corn where bought. They haul a car 30 or 40 miles farther away for less money than they will drop the car on the way, and they thus build up one town at the expense of another. (114, 115.)

Mr. HARRISON thinks that the Federal Government ought to take control or regulate by supervision, and not by governmental ownership, the transportation business of the country. He thinks the powers of the Interstate Commerce Commission ought to be enlarged so that the tariff and classification should originate with that commission instead of being suggested to them, as it is now. He thinks the decisions of the Interstate Commerce Commission should be enforced until reversed and set aside by the court. He also thinks the rule in regard to competitive points needs changing, because there is no necessity for passing by a station and carrying a car to another station for less money. (115.)

Mr. SIMPSON says that the railroad corporations of South Carolina are not taxed by the local assessors who tax the other property in the county, but are taxed by the railroad commission, which was a State board for the purpose of taxing and equalizing all the taxes on all the railroads in the State. He had heard of no dissatisfaction about the amount of taxes that the railroads are paying; in fact, he rather thinks the State is a little severe on them in this respect. (105, 106.)

B. Certain New England manufacturing towns.—1. Lowell.

Manufacturing corporations.—Mr. SMITH testifies that the Lowell corporations have a capital stock of about \$20,000,000, which is steadily increasing and only about one-fifth of which is owned in Lowell. The remainder is held by Boston capitalists. The State of Massachusetts allows a corporation to increase its stock one-third if it will put it in small shares, but no Lowell corporation has availed itself of that law. There are more than one-third as many stockholders as there are employees in the mills, the average holding being about \$3,000 per person. Only a very few hold large blocks of stock. In the older corporations, a great many small share lots are held by the old operatives.

Most of the old corporations of Lowell are very conservative and nonspeculative institutions with no water in their stock. They usually retain the old system of selling goods through agents, and occasionally on commission. The transactions are very large in most of the classes of goods and many of them go out of the country. The New York market takes a good many orders. The higher and finer goods obtain a domestic market very largely. They are made in small lots and greater varieties. (69-70, 73-74.)

Nationalities.—Mr. SMITH testifies that in the Lowell mills every race is represented, and the attempt has been made to find men who would work cheaply enough to keep the line of goods in competition with sections of the country where work and living are cheaper. He says that in one evening school there were 60 boys from Sparta. There are large numbers of French Canadians, English, Swedes, Greeks, Jews, Poles, and Portuguese. He doubts if over 15 per cent of the operatives are English or American born. About 5 per cent are Greeks, and over 42 per cent French Canadians. A portion of the latter are transient, but the French section of the city is growing rapidly. Every race appears to be bettering its condition. The Irish are filling the best positions. The different nationalities when they first come to the city do not assimilate with others, but they show a disposition to assimilate later on. The French have maintained parochial schools, at the instance of the church, in their own language, but the State law of Massachusetts requires every pupil to be educated in English as well, and these French schools must, therefore, teach English also. The Greek colony live together largely and have taken the section formerly occupied by the Irish and driven them out. They also have their own churches and schools, but the older immigrants are becoming assimilated. The French are very thrifty, and the Norwegians and Swedes are the most thrifty class that comes. The witness thinks the city ranks fairly well with other cities in morality. There is a compulsory education law requiring that those who work in the mills shall have attended school. One-third of the city revenue is spent on the public schools, and a large part of this sum goes to the people who work in the mills. (71, 72.)

2. *New Bedford.*—Mr. BROOKS testifies that a considerable percentage of the population of New Bedford are Portuguese, who make very fine citizens. The percentage of native-born Americans is small and they are generally found in the higher positions. A large proportion of the population is English and there are some French Canadians. The English and the Portuguese form the bulk of the foreign-born population. About 25 or 30 per cent of the workers in the mills are Portuguese. They have churches of their own, but they attend the public schools. They are very thrifty and after a few years often save enough money to buy a little farm. (77.)

C. Immigration into the South.—Mr. FRISSELL says there is quite a large movement of Northern and Western people to the South. There is some foreign immigration of Italians into Louisiana. (90.)

Dr. DABNEY says the farmers and land owners who have emigrated from foreign countries and from other sections of the United States are doing a great deal toward

the development of the South, and there is plenty of room for them. The witness thinks the native Americans are preferable to foreign immigrants, and he says the best people that come into the South are from Ohio, Indiana, Illinois, and the great Northwest. (192.)

D. Political institutions in Georgia.—1. *Local governments.*—Professor Du Bois testifies that there are several sorts of local governments in Georgia. Under the old system the county was governed by 3 judges of the inferior court appointed by the governor, and then gradually in the back districts the work fell into the hands of the clerk of the court, who was called the Ordinary; so that up until the time of the war the Ordinary in most Georgia counties was the man who had practically all the power in his hands, such as collecting taxes, etc. The powers of the Ordinary continued after the war, but his method of appointment was changed, so that he was appointed by the governor or the judges of the supreme court. Afterwards, in a county like Dougherty, the Ordinary was given simply judicial work, and the work of collecting taxes and attending to the roads was put into the hands of the county commissioners, who are appointed by the grand jury, and that body is appointed by the judge of the superior court, who must be appointed by the legislature, the result of which is that no negro has anything to do with the local government. In Fulton County the majority of voters are white, and the officers are elected. In Liberty County, where nearly all the negroes own land, the county commissioners were appointed by the governor about 20 years ago, and they have been appointing themselves ever since. The mayor of the town of Darien is appointed by the governor. The counties are independent and are like little States, and the legislature has the right to give any county any sort of government. If the county has a big negro majority, it is given a government that does not go by majority rule. In Dougherty County there are some colored justices of the peace and small officers of that kind, usually appointed by the judge of the superior court, although it is difficult to find out just what the special laws of the legislature are in relation to any county. As a rule the negroes do not take any particular interest in politics, because their votes are not counted even if cast. Dougherty County, although the government is in the hands of one party, is particularly well governed. (167, 168.)

2. *Tax system.*—Professor Du Bois testifies that the people of Georgia complain a great deal of taxation. He thinks it is because taxation falls upon the land owner and country people more heavily than upon any other class. There is no good system of assessment. There are no tax assessors in the country districts and a man simply gives his sworn account of what property he owns. There are tax assessors in the cities. The property owner comes in and gives his sworn statement, which is subject to revision by the assessors, but, as a matter of fact, it is never revised in the case of an influential man. (174.)

E. Pure and adulterated foods.—1. *Adulteration of foods and other products.*—Professor DAVENPORT, dean of the College of Agriculture and director of the Agricultural Experiment Station, University of Illinois, says that the word "adulteration" is a word very difficult of definition in the law. If the lines of division are drawn hard and fast, odium and disgrace will be heaped upon things which are themselves entirely respectable. Legislation should aim to make known the actual composition of materials rather than to determine whether they are adulterated. The fertilizer business furnishes valuable information along this line. There are thousands of brands of fertilizers, and nobody cares what name they go by, but everybody is interested in their composition. In most of the States the manufacturer or dealer, or both, can be prosecuted for selling fertilizers which deceive the buyer. In the matter of seed adulteration, sometimes rock is ground and mixed with clover seed and turnip seed, and the adulteration can not easily be detected, but this would be less injurious than if the seed was sold as it comes from the field, very often with weed seeds in it.

Replying to the argument that to compel the publication of the composition of food stuffs would require manufacturers to publish trade secrets, the witness says that a trade secret might be protected by a patent just as well as the secret of the maker of a machine, which is known to everybody. He says the adulteration of milk is settling itself very rapidly in some places by standardizing milk. People as a rule do not care so much whether they are getting watered milk or skimmed milk, or milk from the cow, as they do to get a certain percentage of cream in the milk. The witness thinks a great deal of damage is done in attaching odium to a healthful article and increasing its price to poor people. Take, for instance, corn meal—one of the most healthful and nutritious of food products. Nothing was ever said against it until it began to be used as an adulterant for flour, when it immediately lost caste. The offense in this instance, as in many others, consists in professing to sell one article and actually delivering another. (133, 134.)

Recent legislation in Illinois is aimed largely at the question of adulteration and the willful nonobservance of the law. The witness does not think the willful element ought to enter into it at all. A uniform law would perhaps be beneficial, in that it would require the companies manufacturing products of various kinds to make the same brand for one State as for another. (134.)

2. *The study of foods.*—Professor DAVENPORT says that in the early legislation respecting foods, there was an attempt made to mix education with the regulation of commercial matters. He does not recommend legislation prohibiting the sale of anything. The effect of this is that the buyer must inform himself as to what the consequences will be of using any particular kind of food or drink. The law can not be expected to say what any one must eat or drink. The public will study the question from the standpoint of hygiene and the standpoint of the proportion of nutrients. The higher education of the individual who buys and consumes has furnished him with definite knowledge as to what he ought to eat. A great deal more is known about stock food than about human dietaries. The reason of this is that in feeding an animal for its development and from the standpoint of economy the matter is a money question, while in feeding ourselves it is a question of tickling our palates. (134, 135.)

Professor Davenport does not think that the proper terms for schools known as "schools of domestic science" has yet been invented, but in these schools very much knowledge of foods and their effects will be obtained. In the early days an undue interest was attached to the hygienic side of the question until the idea of the study of foods in the minds of a great many people meant simply a study of narcotics or stimulants. What is needed is a study of normal food stuffs—the normal nutrition of the normal body in health. (135.)

Professor Davenport thinks that legislation, either National or State, if enacted at all should be along lines establishing departments for the study of food subjects in colleges and public schools. (139.)

3. *Pure food laws.*—Mr. HUNNISON thinks that it is of great importance for the United States Government to pass stringent pure food laws for the entire country, which should include everything a man eats and drinks and all the fuel he uses. There is a great deal of adulteration of food supplies and of oil at the present time. Some of the States have very stringent laws on the subject, but others have not, and it is very difficult to enforce laws where they are not uniform. Everything that is sold ought to be branded as to what it is, so that everyone can tell just what he is buying. (117.)

F. Pauperism and crime.—Dr. HARRIS says that pauperism is on the decrease in all the States which have a proper division of labor between agriculture, manufacture, and commerce. The standard of poverty, too, has been raised, and that class of persons who formerly were obliged to shift for themselves now receive aid from the public. The basis of crime has changed. The grosser kinds of crime were more frequent formerly than now, and little account was taken then of many crimes which are now pursued with severity. Many vices formerly tolerated by society—such as drunkenness, for example—have been transferred to punishable offenses. The brilliant attack led by Mr. Richard Grant White some years ago in the *North American Review*, and recently an article in the *Popular Science Monthly* by Mr. Reece attacking the public school system, have been thoroughly answered, showing that the class of crimes that were on the increase were crimes of a lesser nature and character, and that there had been a decrease in serious crimes of 44 per cent. Persons and property have become safer in the last 25 years, while drunkenness is not nearly so safe; the prisons and jails are crowded with intemperate people who were formerly allowed to go unmolested. Any species of crime that goes unpunished tends to increase and multiply criminals. Honesty and truth speaking, two of the phases of justice, are particularly cultivated in the public schools. Temperance is also taught to a certain extent in the schools. (49, 50.)

Dr. HARRIS says there are three classes of weaklings in society: (1) The weakling in thrift, who produces pauperism; (2) the weakling in morals, who is responsible for crime; and (3) the weakling in intellect, who fills the asylums of the insane and feeble-minded. These weaklings need nurture more than justice. The principle of competition, which comes down to us from Rome, is regarded as the basis of individual success in life. This is a higher idea than communism and socialism, but it is not adapted to the weaklings of society. The competitive system crushes rather than aids them. (51.)

TESTIMONY.

GENERAL AND INDUSTRIAL EDUCATION.

TESTIMONY OF DR. WILLIAM T. HARRIS,

Commissioner of Education.

At a meeting of the Industrial Commission at its offices in Washington, D. C., Vice-Chairman Phillips presiding, Dr. William T. Harris, Commissioner of Education, appeared and testified.

Dr. HARRIS. Mr. Chairman and gentlemen of the commission, what I have prepared for this conference is not so much a systematic treatise on the questions proposed to me as a general talk, and I should like the privilege of writing out the points that your commission deem to be important for your purpose.

Under proposition 6, Immigration and Education, I find a question relating to the school age of children in the several States. I beg leave to present the following table, showing the school age in the several States of the Union. (See columns 1, 2, and 3):

Certain statistics of education in the United States for 1898-99.

State or Territory	Age for free attendance at the public schools.	Age for compulsory attendance.	Number of different pupils of all ages enrolled.	Per cent of the school population (5 to 18 years of age) enrolled.	Per cent of the total population enrolled.	Total amount expended for schools.	Expend per capita of population.
1	2	3	4	5	6	7	8
United States.....			15,138,715	69.34	20.47	\$197,281,603	\$2.67
North Atlantic Division.....			3,621,226	69.44	18.01	76,205,008	3.70

a No compulsory-attendance law.

It will be seen that the ages which are fixed by the States respectively are not uniform. The school age recognized by the United States Census is from 5 to 18, but in many of the States the school age is from 6 to 21 (18 States), or from 6 to 18 years (6 States), and in some cases the period from 5 to 21 (11 States) has been adopted; in others, 6 to 20 (4 States) and 6 to 18 (6 States). The States that have adopted compulsory education, of course, have fixed a much shorter period during which time the parent is compelled under penalty to send his children to school. The school age means the period within which children may attend school and demand a share of the public money for their education. The compulsory age includes the period during which they are required to be at school under penalties for a certain portion of each year. The provision fixing school age is not interesting or important as a matter of general statistics; but it is very important as an item for the State officer who distributes the school fund, because the various minor divisions of the State draw from this school fund in proportion to their number of children of school age. The compulsory requirement is interesting as a matter of general statistics, because it shows the zeal and determination of the State to educate its people. It is an index of public opinion in school matters. The foregoing table shows (column 3) the States that have adopted compulsory education and the periods respectively in which the compulsion is operative.

A more important item of statistics with regard to schools is that of the actual average attendance on school. This indicates what is realized in regard to education in each State, and not what is merely proposed on paper. From this item one can calculate exactly the proportion of an entire education that a given State or section is actually giving to its people. It gives the net result of the school system.

I insert here a table from my last report (see column No. 8). Columns Nos. 2, 3, 4, and 5 show the number of days annual session in the several States at different dates.

(1) Average length of school term at various periods; (2) aggregate number of days' schooling given to all pupils; (3) the same compared with the school population and the enrollment (columns 7 and 8).

State or Territory.	Average number of days the schools were kept during the year. a				Aggregate number of days' schooling given in 1898-99.	Average number of days' schooling given for every child 5 to 18 years of age in 1898-99.	Average number of days attended by each pupil enrolled in 1898-99.

a Certain States report their school term in months; these months have been reduced to days by multiplying by 30.

b In 1897-98.

c In 1896-97.

c Approximately.

d In 1891-92.

f Includes only pupils of legal school age (5-17 years).

I have been attempting the last 5 years, in my Annual Report, to give precision to this item. The tables herein show my results.

It will be seen that the total amount of schooling given on an average to each inhabitant in the United States by all schools, public and private, is nearly 5 years of 200 days each. It will be seen, too, that there is a wide limit of variation in the several sections of the United States. The year in this item of statistics is reckoned at 200 days. In rural districts the school year very rarely contains so many as 200 days. Usually it is only 3 or 4 months and contains only 90 school days, or even less. The States that have comparatively few cities average a very small number of days in the school year. For instance, the South Atlantic Division, comprising the Gulf States, has comparatively few cities or large villages, and its average school year is so short that the total amount of schooling given to each inhabitant (measured in years of 200 days each) is only 3.05 years, while the North Atlantic Division, the region of the largest cities, is giving to each inhabitant an average of 6.70 years of 200 days each.

Average number of years of schooling (of 200 days each) that each individual of the population received at the different dates specified in the table, and taking into account all public and private schooling of whatever grade.

a Subject to correction.

I have given in the second table, column 5, a comparative view showing the average number of days in the school year for the several States, including urban and rural schools and the same aggregated for the five sections of the United States. The total number of school days for the whole country has been gradually increasing. The reason for this is chiefly the growth of cities and large villages rendered possible by the railroad and the increasing wealth of the country. The growth of villages in the South appears as an important item in the lengthening of the school term. The school term in the South has ascended from an average of 94 days in the year 1870 to an average of 108 days in the year 1890.

Q. (By Mr. SMYTH.) What did you mean by saying that the South has more children under 6—at school, you mean? Families are larger?—A. The percentage of school population in the South, say from 6 to 18, is shown by the United States census for 1890 to be larger than it is in the North. The families are larger and there are fewer old people.

The census for 1880 showed that the number of children 6 to 13 years, inclusive, was 19.45 for each 100 inhabitants of the whole United States, but the North Atlantic Division numbered only 16.92, while the South Atlantic Division numbered 21.37. The North Central Division numbered 19.74, while the South Cen-

tral Division numbered 22.16, but the Western Division numbered only 16.13. Again, the same census showed that the children from 4 years to 20 years, inclusive, for the whole United States numbered 39.26 out of every 100 of the population, while the North Atlantic numbered 35.42 and the South Atlantic numbered 42. The North Central numbered 40.09, while the South Central numbered 43.02, and the Western Division only 33.61.

The Southern States of the Union have a larger percentage of children than the Northern States, especially the Atlantic Division of the Northern States. It is supposed that the effects of the civil war, the extraordinary strain in physical and mental exertion, and the worries and discouragements attendant on the results have caused the percentage of persons over 40 years of age to be much less than the percentage of people of similar age in the North.

What is the nature of the education given in the elementary schools? What does it do for the people?

The first and most important thing, it seems to me, in the United States is to make everybody a reader. Each person of a proper age should be able to write and read. The illiterate person is not able to work by himself except in the simplest kinds of employment. He requires constant direction from a "boss." The person who can read and write can follow written or printed directions and can be held responsible to do good work when he is not under immediate supervision. More and more it happens that the work of a community gets to be of such a kind as to demand in the laborer a knowledge of reading and writing. An illiterate man can not deliver the orders of a grocery store or market. He must be able to read the names of the customers and the names and numbers of the streets where they are to be found. He can not correct any errors in his order unless he is able to make a memorandum of the errors.

But it is still more important for a free government that its inhabitants are able to read and write. The free government must be a government chiefly of popular opinion, and popular opinion can not govern effectively except through the newspaper and the book. There must be a means by which the individual learns every day to know the opinions of his fellow-men near and far. He interprets the opinion of his fellow-citizens whom he meets from day to day by the opinion of surrounding communities, made known to him through the newspaper. Again, he interprets the public opinion of his State by the public opinion of other States. He interprets the public opinion of his nation by the public opinion of foreign nations. Thus there goes on in the mind of each citizen a comparative study of public opinion, the readjustment of local opinion and sentiment to the aggregate of public opinion and sentiment of States and nations. The general public opinion of the world is a kind of "writing on the wall" in which the individual or the particular section sees that its local view of affairs is weighed and approved or else found wanting.

It is of all importance that the individual shall know the opinion of his community. He does not undertake what will be condemned by the neighborhood in which he lives. So it is important for States and sections to know the public opinion of the nation; and it is important for the nation to know the public opinion of the world. Ignorance in this respect leads to useless wars or to useless undertakings which consume the strength of the people and yet have to be abandoned after much waste of labor.

I have frequent opportunity to see intelligent foreigners who visit this country to study our institutions. These people often misunderstand our newspapers. They are scandalized by the way in which the newspaper violates the sacred right of privacy on the part of the individual and the family. Our idea of freedom of the press is frequently confounded with that of license of the press. But I have told these visitors that they could not make a greater mistake in explaining the Government of the United States than by misreading the influence of our newspapers.

One has frequent occasion to notice the difference when he passes from any nation on the continent of Europe across the channel to Great Britain. He comes from a nation comparatively uninfluenced by the newspaper to a country which seems to rely upon the newspaper for the regulation of its daily affairs. In all countries there is daily gossip relating mostly to narrow circles—the village, or the neighborhood. In England it is noticeable that the village gossip is supplemented through the newspaper by world gossip. In this way we see that the Anglo-Saxon people, whose chief political device is local self-government, have invented a means for making their individualism safe for the nation.

But the American newspaper far surpasses the English newspaper in taking hold of the life of the individual. Information in an English newspaper is served

up in the form of elaborate articles, as if written for encyclopedias. The colloquial style of the people is studiously excluded from newspapers and periodicals. In America, on the contrary, the colloquial style of the street and the shop is sought and imitated. The lofty thoughts, the complex details, are written down to the level of the reader. Each reader in America can get far more from his morning newspaper than the Englishman can get from the newspaper of his own country.

The process of creating public opinion, and the process of reducing conflicting currents of public opinion to one standard, are realized far more successfully in this country than in any other. There is, however, an obvious limitation upon this process. A newspaper public opinion can not penetrate an illiterate community. It results, therefore, that such an illiterate community must be governed by violence, or by external authority secured by other means. The newspaper community is therefore a freer community, because people see the different sides of the question discussed and adopt their own conclusions without reference to immediate external authority. Our newspapers have improved from year to year in this ability to take up great questions and present them intelligibly to people having mere rudiments of education.

Some of these great questions are seen by the mass of the people to be very important in their effects upon the welfare of each inhabitant. They are not all of them remote questions or questions in which nations are more interested than the individual citizen. Take the socialistic question. The idea has been circulated industriously that the rich are growing richer and fewer and the poor growing poorer and more numerous. This idea was suggested by Karl Marx in his great work on Capital. It has been echoed by Henry George in his book on Progress and Poverty. If every census was made to show the exact items with regard to the wealth of the population and its distribution, an answer would be ready at hand for the newspaper to refute this socialistic doctrine founded on this supposed fact. It would be easy for the United States Census to make a careful study of the assessments throughout the United States, and show accurately how much of the property of the country is in land and how much of it is in buildings and other improvements. With this fact established, the question of Henry George's theory as to the evil in individual ownership of land could be easily settled. No doctrine is dangerous to a newspaper-reading people provided the real merits of the doctrine have been ascertained and their results canvassed and reduced to the popular form of newspaper articles.

In my opinion, the principle stated by Karl Marx has been refuted and the supposition of Henry George with regard to the effect of individual ownership in land has been disproved. But the simple and obvious manner of refuting those discouraging doctrines by an exhibit of the actual facts has not been adopted. I presume it is one of the objects of your Industrial Commission to point out to the Government the proper means of ascertaining the data that underlie social discussions. The laborer must have data given him that he can not question, otherwise he will take inaccurate statistics or baseless generalizations for unquestionable truth. Particular cases of suffering or of unjust distribution of wealth will be quoted, and general conclusions drawn from them. What I have called "hysterical statistics" will be accepted instead of sound and health-giving statements of fact.

Q. (By Senator MALLORY.) Before you leave that branch, have you compared the relative attendance in this country and Great Britain, say, or in France or Germany?—A. Yes, sir; a comparison has been made between the school statistics of this country and that of other countries. We have to note in the first place that the United States has a greater rate of increase in population than other countries. Besides this, the number of persons reaching old age is not quite so great as in some of the countries of Europe. The consequence is that the school population, say from 6 to 18 years, is a larger percentum of the total population than it is in England, France, Germany, or the Scandinavian countries. In the United States the per cent of the population which attends school some portion of the year is 21, while that in England is about 17, Germany 18, and in some divisions, say in Saxony, 20 per cent. That of Spain 7½ per cent; that of Italy 7½ per cent. I present here the following table showing the percentage of the population in school in the principal countries of the world according to the latest information obtainable at the Bureau of Education:

tral Division numbered 22.16, but the Western Division numbered only 16.13. Again, the same census showed that the children from 4 years to 20 years, inclusive, for the whole United States numbered 39.26 out of every 100 of the population, while the North Atlantic numbered 35.42 and the South Atlantic numbered 42. The North Central numbered 40.09, while the South Central numbered 43.02, and the Western Division only 33.61.

The Southern States of the Union have a larger percentage of children than the Northern States, especially the Atlantic Division of the Northern States. It is supposed that the effects of the civil war, the extraordinary strain in physical and mental exertion, and the worries and discouragements attendant on the results have caused the percentage of persons over 40 years of age to be much less than the percentage of people of similar age in the North.

What is the nature of the education given in the elementary schools? What does it do for the people?

The first and most important thing, it seems to me, in the United States is to make everybody a reader. Each person of a proper age should be able to write and read. The illiterate person is not able to work by himself except in the simplest kinds of employment. He requires constant direction from a "boss." The person who can read and write can follow written or printed directions and can be held responsible to do good work when he is not under immediate supervision. More and more it happens that the work of a community gets to be of such a kind as to demand in the laborer a knowledge of reading and writing. An illiterate man can not deliver the orders of a grocery store or market. He must be able to read the names of the customers and the names and numbers of the streets where they are to be found. He can not correct any errors in his order unless he is able to make a memorandum of the errors.

But it is still more important for a free government that its inhabitants are able to read and write. The free government must be a government chiefly of popular opinion, and popular opinion can not govern effectively except through the newspaper and the book. There must be a means by which the individual learns every day to know the opinions of his fellow-men near and far. He interprets the opinion of his fellow-citizens whom he meets from day to day by the opinion of surrounding communities, made known to him through the newspaper. Again, he interprets the public opinion of his State by the public opinion of other States. He interprets the public opinion of his nation by the public opinion of foreign nations. Thus there goes on in the mind of each citizen a comparative study of public opinion, the readjustment of local opinion and sentiment to the aggregate of public opinion and sentiment of States and nations. The general public opinion of the world is a kind of "writing on the wall" in which the individual or the particular section sees that its local view of affairs is weighed and approved or else found wanting.

It is of all importance that the individual shall know the opinion of his community. He does not undertake what will be condemned by the neighborhood in which he lives. So it is important for States and sections to know the public opinion of the nation; and it is important for the nation to know the public opinion of the world. Ignorance in this respect leads to useless wars or to useless undertakings which consume the strength of the people and yet have to be abandoned after much waste of labor.

I have frequent opportunity to see intelligent foreigners who visit this country to study our institutions. These people often misunderstand our newspapers. They are scandalized by the way in which the newspaper violates the sacred right of privacy on the part of the individual and the family. a Also 90,305 in model schools and academies.

b Not including expenditure for buildings, books, etc., and for scholarships which were included the previous year.

France, Spain, and Italy made a great effort to bring into school all children of school age after the Franco-Prussian war. The universal prevalence of education in Germany was thought to be a powerful factor in the success of German arms. At all events, other nations imitated Germany in the attempt to secure school education for all their inhabitants. Hence the results in the table I have presented above show that France has 14½ per cent of its population in school; England, 17; Italy, 7; whereas before 1875 the schools of these nations enrolled much smaller proportions.

THE INDUSTRIAL SIDE OF EDUCATION.

There has been a great activity tending to the adoption of new industries in the United States, especially since the international fair held at Philadelphia—the Centennial Exposition. It is interesting to note that Russia in her exhibit on that occasion showed what could be done in the way of reducing the elements of trades to a teachable form. When the elements of industries have been brought into a pedagogic form, they can be taught in progressive lessons to the classes. This is a much less expensive form, both for teacher and learner, than the so-called apprentice system. The Russian Government, after the Crimean war, became aware of the fact that there were more people producing raw material,

especially in the form of agricultural production, in proportion to the total population, and a smaller ratio of people engaged in manufacturing and commerce than in any other country in Europe. Russia is a very important nation to study for lessons in political economy, because the heads of the Government in Russia have seen what is necessary to do in their national housekeeping in order to make their people strong against the nations of western Europe. A nation that depends entirely upon agriculture, even if it is a fertile country, will not be a wealthy country. Let it produce enormous quantities of agricultural productions, whether of grazing or tillage, and if the products have to be sent a quarter of the way around the world to a distant land to buy the necessities and creature comforts which are furnished by manufactures, the necessary cost of the transfer and exchange reduces the net result of the labor of the people to a moderate amount of wealth. This is the case even in Australia. The home productions of agriculture and grazing in Russia would not seem, from statistical returns, to amount to more than 6 or 7 cents per inhabitant per day. But the skilled workmen introduced into the villages and cities of Russia from the west of Europe, together with the school shops for the training of skilled labor, have increased the wealth of Russia so that the annual product is somewhere between 12 and 14 cents for each individual and the rate is continually increasing. We have all read the history of Peter the Great who set the example to his monarchy and taught them how to increase the industrial power of the nation by adopting the inventions and the skilled labor of western Europe. The village-community idea still prevails in the civilization of Russia, although it has been outgrown by the peoples of western Europe. The village community is an advance on tribal civilization, but its productive industry, as compared with that of Holland or England, is far inferior. The free owning of land in severalty is a much more productive form of agriculture than the possession of land in common or than the cultivation of it in common.

Q. (By Mr. A. L. HARRIS.) What is the production in the whole United States? Is not that the highest of any nation except Australia? What was it in 1880? What was it in 1890?—A. In reply to your question I will ask permission to quote from an article of mine in the Forum for October, 1897, in which I have given the results of my studies on the United States census from 1850 to 1890, indicating my method of ascertaining the aggregate earnings of the United States, stated in the form of the average daily earning of each inhabitant. To this I have appended certain statistics derived from Mulhall and others regarding the average daily earnings of the inhabitants of Great Britain, France, Germany, Russia, Austria, Spain, and Italy, together with the increase of the use of steam power in those countries.

"The most important item of economic statistics is that which shows the total product of the State or nation in the form of the average per day for each inhabitant. This item helps the individual citizen to compare his daily wages or his annual income with the quota which he would receive in case the total product of his State or nation were distributed to each inhabitant without any deductions for capital, for land, or for supervision.

"A continual view of this ratio is most healthful for all members of the community. Any person socialistically inclined will ask himself, What does my whole State (Massachusetts, for example) or my nation (the United States, or Russia, or France) produce per day per inhabitant? Taking the wage-earners as about one-third of the population, let each one multiply the average quota per inhabitant for the United States by 3 and compare it with the wages he himself is receiving. The result is astonishing to most persons who take pains to get an accurate inventory of the productions of the nation. According to the census of 1890 the total value of farm products, including live stock, amounted to \$0.108 per inhabitant for the whole United States, the manufacturing products to \$0.184, the mining products to \$0.0254, making a total in these three great items for each individual of \$0.3174 (not quite 32 cents) per day, or \$2.2218 per week, or \$9.522 per calendar month. Multiplying by 3, to obtain the representation of the average wage-earner, we find that he stands for \$6.6654 per week, or \$28.563 per month. The particulars for the several States are given in the following table:

"Amount per day per inhabitant, by States.

[United States census of 1890.]

Divisions and States.	Value farm products.	Value manufactured products.	Value mining products.
North Atlantic Division	\$0.066	\$0.357	\$0.0324

Washington	.107	.171	.0235
Oregon	.100	.171	.0108
California	.107	.211	.0447

"These estimates take the farm products at the farm and the manufactured products at the mill; but there is an immense industry on the part of the people, namely, that of transportation, which adds to the value of the total product by the time it gets to the hands of the consumer. This item for transportation amounts to \$1,076,940,357 per annum, or \$0.047 per day for each person. Besides this, in the agricultural estimate above there has been no account made of the small gardening and other home agriculture, nor of the home manufactures which relate to the final processes of preparation of food, and especially to the making of clothing—items not reported in the census. The former item, which will include the product of household gardens and small farms, may be estimated at 4 cents a day for each inhabitant, or \$14.60 a year. This estimate makes the amount of agricultural productions not reported 37 per cent of the amount

reported in the United States Census—an amount apparently too large. The household manufactures which do not get reported in the census (including cookery, sewing, etc.) are also counted at 4 cents per day, or \$14.60 a year.

" Besides these items there is a large contribution to the wealth of the country in the way of use or rental of houses and furniture already existing. Agricultural tools and machinery have been accounted for in the agricultural product. As regards houses and furniture: Allow for the rental of houses and furniture, 4 cents per day; for railroad building, \$0.013, and for miscellaneous, \$0.015. I bring together these items in the following table:

For the United States.	Value for 1889.	Per inhabitant per day.
Value, farm products	\$2,460,107,454	\$0.108
Value, manufactured products	4,210,303,207	.184
Value, mineral products	580,012,600	.0254
Value, products fisheries	44,277,514	.002
Freight earnings (land)	734,525,726	.032
Drayage, etc. (estimated), 18 per cent freight earnings	157,414,431	.007
Freight earnings, water (estimated)	140,000,000	.006
Expressage (estimated)	45,000,000	.002
House rent (estimated)	680,000,000	.030
Furniture rent (estimated)	228,571,212	.010
Railroad building (estimated)	300,000,000	.013
Household manufactures not reported (estimated)	914,284,848	.04
Agricultures not reported (estimated)	914,284,848	.04
Miscellaneous (partly estimated)	342,856,818	.015
Total	11,751,728,858	.5144

" The total sum is \$0.5144 for each person, or \$1.5432 for each wage-earner per day, or \$10.80 per week. Any person, therefore, receiving \$11 dollars a week receives more than the quota that a wage-earner would receive (representing three persons), provided nothing were paid for interest on capital, for the use of land, or for directive power. It is interesting to compare with this the estimate which Mr. Mulhall makes in his recent book, *The Industries and Wealth of Nations* (1896). Comparing the same with the production per day of each inhabitant of Europe the figures are:

	Europe.	United States.
Farms	\$0.057	\$0.0855
Manufactures0774	.21
Commerce and transportation0586	.1250
Personal service and miscellaneous052	.102
House rent and furniture02	.05
Total2450	.6025

" The study of statistics of national earnings is helpful to those who are disposed to think that an equal division would place the entire population in a condition of luxury. But this is only a negative lesson. It is far more serviceable to learn the exact facts regarding the trend or progress of wealth as respects both its aggregate and its distribution.

" The returns from the income tax of Great Britain afford means of tracing the growth of incomes among all classes in that country. The following figures from Leone Levi's 'Wages and earnings of the working classes' (for Great Britain) (p.48) bear directly on the supposed law of Karl Marx:

Incomes of—	1850-51.	1870-80.
\$750 to \$1,500	68,864	341,568
\$1,500 to \$2,500	21,367	61,615
\$2,500 to \$5,000	12,258	29,839
\$5,000 to \$15,000	4,708	11,496
\$15,000 to \$50,000	1,551	4,085
\$50,000 to \$250,000	312	910
\$250,000 and over	26	77
Total	144,322	398,835

"The population increased only 33 per cent between 1850 and 1880, but the middle class (incomes \$750 to \$5,000) trebled—102,489 in 1850 to 333,022 in 1880. The moderately wealthy class (incomes \$5,000 to \$15,000) more than doubled—4,708 to 11,495. The laboring class,¹ whose annual incomes are less than \$750, averaged in 1850-51 \$265; in 1881 the average had risen to \$415; 180,000 or more had ascended from the poor class into the class paying an income tax.²

"The production of the United States has risen from an average of 30 cents in 1850 to nearly 51½ cents per day for each inhabitant in 1890. This estimate, compared with that of 1890, given in cents per day, is as follows:

	1850.	1880.	1890.
	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>
Agriculture (including live stock).....	12	14.5	10.8
Manufactures as reported.....	5.8	10.8	18.4
From transportation in enhanced value of products.....	1.2	3.7	4.7
Agricultural product consumed in the household and not reported.....	3.2	4.1	4
Household manufactures not reported.....	4.8	4.4	4
Building of railroads.....	.75	1.8	1.3
Mining, fisheries, and miscellaneous.....	.25	2.2	4.24
House and furniture rent.....	2	3	4
Total per day for each person.....	30	44.5	51.44

"The increase in aggregate earnings is encouraging, and still more so is the evidence of its distribution among all classes of people.

"Since the advent of steam and labor-saving machinery the average annual production has continued to rise, and the amount saved and handed down for use in succeeding years has grown larger. According to Mulhall's tables³ steam power itself has increased in the United States since 1860 from 3½ millions to 17 millions horsepower in 1895; Great Britain and Ireland from 2½ to 13 millions horsepower; Germany from seven-eighths of a million to 7½ millions horsepower; France from 1½ to 5 millions horsepower. Italy (1½ millions horsepower in 1895), Spain (1½ millions), Austria (2½ millions), and Russia (2½ millions) have not yet become great users of steam, and their productive power per inhabitant is less."

"The daily earnings per inhabitant increased as follows (Mulhall):

	Daily earnings.		Increased in 1894-95 to —
	Year.	Amount.	
United Kingdom.....	1890	\$0.43.8	\$0.49.3
France.....	1890	32	42
Germany.....	1896	25.6	34.2
United States.....	1890	38.6	58.8
Russia.....	1894	10.9	12.6
Austria.....	1899	19.6	21.7
Spain.....	1890	18.5	20.6
Italy.....	1890	16.3	18.6

The average production of each inhabitant in the United States for 1890 appears to be about 51½ cents. It is possible that England is a little more than that if we take into consideration the English capital invested in manufacturing and transportation in other countries. England levies toll upon the productions of all other nations on account of capital invested in their railroads, manufactures, and public works. Her capital has gone out to build such plants as water works, gas works, street railroads, highways of transportation, iron and steel works, breweries, cotton manufactories, etc. But aside from the income from investments of capital, it would seem that the industrial productions of Great Britain and Ireland amount to something less than 50 cents for each man, woman, and child per day. Based on the same estimate as for 1890, the production of the United States per day per inhabitant was 44½ cents for 1880, and for 1860, 30 cents,

¹ See Levi, Wages, etc., p. 53.

² For similar statistics, comparing 1843 and 1880, see Mr. Giffen's article in the Journal of the London Statistical Society, 1883, and the discussion of the same in The Present Distribution of Wealth in the United States, by C. B. Spahr, pp. 93, 94.

³ Industries and Wealth of Nations, p. 379.

reported in the United States Census—an amount apparently too large. The household manufactures which do not get reported in the census (including cookery, sewing, etc.) are also counted at 4 cents per day, or \$14.60 a year.

" Besides these items there is a large contribution to the wealth of the country in the way of use or rental of houses and furniture already existing. Agricultural tools and machinery have been accounted for in the agricultural product. As regards houses and furniture: Allow for the rental of houses and furniture, 4 cents per day; for railroad building, \$0.013, and for miscellaneous, \$0.015. I bring together these items in the following table:

For the United States.	Value for 1889.	Per inhabitant per day.
Value, farm products	\$2,460,107,454	\$0.108
Value, manufactured products	4,210,303,207	.184
Value, mineral products	580,012,600	.0254
Value, products fisheries	44,277,514	.002
Freight earnings (land)	734,525,726	.032
Drayage, etc. (estimated), 18 per cent freight earnings	157,414,431	.007
Freight earnings, water (estimated)	140,000,000	.006
Expressage (estimated)	45,000,000	.002
House rent (estimated)	680,000,000	.030
Furniture rent (estimated)	228,571,212	.010
Railroad building (estimated)	300,000,000	.013
Household manufactures not reported (estimated)	914,284,848	.04
Agricultures not reported (estimated)	914,284,848	.04
Miscellaneous (partly estimated)	342,856,818	.015
Total	11,751,728,858	.5144

" The total sum is \$0.5144 for each person, or \$1.5432 for each wage-earner per day, or \$10.80 per week. Any person, therefore, receiving \$11 dollars a week receives more than the quota that a wage-earner would receive (representing three persons), provided nothing were paid for interest on capital, for the use of land, or for directive power. It is interesting to compare with this the estimate which Mr. Mulhall makes in his recent book, *The Industries and Wealth of Nations* (1896). Comparing the same with the production per day of each inhabitant of Europe the figures are:

	Europe.	United States.
Farms	\$0.057	\$0.0855
Manufactures0774	.21
Commerce and transportation0586	.1250
Personal service and miscellaneous052	.102
House rent and furniture02	.05
Total2450	.6025

" The study of statistics of national earnings is helpful to those who are disposed to think that an equal division would place the entire population in a condition of luxury. But this is only a negative lesson. It is far more serviceable to learn the exact facts regarding the trend or progress of wealth as respects both its aggregate and its distribution.

" The returns from the income tax of Great Britain afford means of tracing the growth of incomes among all classes in that country. The following figures from Leone Levi's 'Wages and earnings of the working classes' (for Great Britain) (p.48) bear directly on the supposed law of Karl Marx:

Incomes of—	1850-51.	1870-80.
\$750 to \$1,500	68,864	341,568
\$1,500 to \$2,500	21,367	61,615
\$2,500 to \$5,000	12,258	29,839
\$5,000 to \$15,000	4,708	11,496
\$15,000 to \$50,000	1,551	4,085
\$50,000 to \$250,000	312	910
\$250,000 and over	26	77
Total	144,322	398,835

to perform simple operations. Simple machines gradually become complex, each one performing several elementary operations. Increase of productive power renders many laborers superfluous in the lower order of production, and then begins a gradual readjustment by the transfer from agriculture to manufacturing, transportation, and professional occupations. This movement, long in progress, was visible in the United States in the decade 1870-1880, and was quite remarkable in that from 1880 to 1890, as shown by the following table:

Employed in—	Census years.		
	1870.	1880.	1890.
Agriculture, etc.....	491.1	460.3	396.5
Professional service.....	29.6	34.7	41.5
Domestic and personal.....	184.8	201.4	191.8
Trade and transportation.....	98.3	107.3	146.3
Manufacturing.....	196.2	196.3	223.9
Total.....	1,000	1,000	1,000

"The figures in this table show the number of laborers in each class of industries for each thousand of all classes. About 100 in each thousand have changed from agriculture to other classes of employment, namely, 48 to trade and transportation, 27.7 to manufactures, 7 to domestic, and 12 to professional occupations. Meanwhile the productions of agriculture continue to be largely in excess of home consumption. Improved planting, cultivating, and harvesting machines make possible a greater product from decade to decade.

"Greater comfort to the workingman is produced by the portion of labor that is expended on transportation. The increase is shown in the following table:

Description of employees.	Census years.		
	1870.	1880.	1890.
Steam railroad.....	12,320	13,576	20,331
Street railroad.....	408	673	1,645
Hackmen and teamsters.....	9,656	10,217	16,210
Total in each million of employed.....	22,384	24,466	38,186

"The steam railroads carry goods from places where they are less in demand to where the demand for them is greater, and thus increase their usefulness. In the case of perishable commodities the saving is identical with the entire value of the goods. Passengers are carried in immense numbers from crowded cities to the suburbs. The same benefit is secured by street railroads. They conserve the strength of the laborer, a large percentage of which was formerly wasted in walking to and from his place of labor. Teamsters assist the railroad in the collection and distribution of freight; and omnibuses, like the street railroads, convey passengers. It has been shown that the number (22,384 persons) employed in these beneficial services out of each million in 1870 has nearly doubled in twenty years. This increase (15,802 in each million) has also been supplied from the lower order of industries, in which machinery has set free laborers no longer needed for the production of necessities.

"It is instructive to note a similar movement in the metals, from the lower order of work toward specializing new trades and increasing skill.

"Formerly the blacksmith performed nearly all the work in iron and steel. Blacksmiths have relatively decreased, while the various trades that go to the specialized iron and steel industries have progressively increased, as the following figures show:

Description.	Census years.		
	1870.	1880.	1890.
Mere blacksmiths.....	11,300	9,935	9,026
All other iron and steel workers.....	14,744	16,050	21,831
Total in each million of employed.....	26,104	25,985	30,857

a Including machinists, molders, makers of wire, cutlery, tools, nails, stoves, furnaces, steam boilers, patterns, and sewing machines, and workers in iron, steel, and other metals.

"The trades evolved from blacksmithing are nearly all applications of machinery, by which the labor of the hand is multiplied from ten to a thousand fold. New inventions, in the case of iron and steel manufacture, nearly keep pace with the expansion of trade in iron and steel products; hence the transfer of laborers from agriculture to this branch of manufacture as a whole is slow, only 4,753 in twenty years, or 21 per cent increase over the quota of 1870."

Besides the tables above given, illustrating the readjustment of vocations since 1870, the following tables show the same facts with regard to certain industries that have to do with the increase of laborers engaged in producing articles of luxury. In this connection, too, it can be mentioned that laborers in the United States engaged in silk manufacture number only 256 for each million of laborers in the year 1870, but in 1880 the number had increased to 1,086, and in 1890 to 1,575:

Industries.	Census years.		
	1870	1880	1890
Stoves and furnaces.....	120	190	396
Upholstery.....	488	598	1,125
Paper hanging.....	192	288	545
Plumbers, gas and steam fitters.....	888	1,116	2,490
Pottery.....	408	414	704
Painters, glaziers, and varnishers.....	6,936	7,496	9,669
Clocks and watches.....	144	704	1,100
Total in each million employed.....	9,176	10,896	16,039

"In the days before machinery and the use of motive power cloth was made by hand, and long after the power loom was invented, the clothing of the family was made at home with such poor skill as might have been expected where there was no division of labor, and each workman tried his hand at everything. Machinery increases the production and hastens the division of labor. In the making of clothing the skillful are attracted to the shop, and a rapidly increasing branch of occupations is formed. Add the dressmakers, milliners, seamstresses, tailors, collar and cuff makers, according to the census report of 1890, and the result shows an increase of 50 per cent in twenty years in the manufacture of clothing as a special occupation. In each million there were 20,752 in 1870, 24,930 in 1880, and 31,170 in 1890. This increase, like that above considered, came from the laboring classes that had been engaged in the production of necessities. Tailor-made clothing belongs to the division of luxury. In the period prior to machinery, as stated above, nearly all clothing was homemade.

"There is a still more numerous class connected with trade, which shows a large increase from decade to decade, viz, bookkeepers, clerks, and salesmen. The subjoined table shows the number of these in each million of employed:"

Description.	Census years.		
	1870.	1880.	1890.
Bookkeepers and salesmen.....	24,880	30,874	44,630
Bankers and brokers.....	880	1,116	1,584
Officials of banking, insurance, and trust companies.....	845	862	1,760
Agents and collectors.....	1,624	1,956	7,680
Total in each million of employed.....	28,229	34,838	55,654

In the present age natural science is increasingly studied by the people. The secrets of nature are discovered. The most advanced people in nature studies are the ones who lead in the discovery of useful inventions. The forces of nature are turned to advantage to conquer nature for human uses.

With the invention of machinery the mere hand laborer loses his place and the more intelligent laborer who can direct a machine is employed instead. The mere hand laborer who may have taken seven years or more of apprenticeship to acquire his trade finds himself left without an occupation. Unless he can quickly learn how to direct a machine, he is obliged to go to the almshouse.

Great Britain is a nation that has distinguished itself for the invention and employment of useful machinery. It has not succeeded so well in making ornaments as France and Belgium have, but in annihilating distance by steamboats and railroads, and by manufacturing raw materials into cheap but durable articles

of use it has led other nations. One may speak of British industry as constantly undergoing transformation by the substitution of more effective machines than those already in use, and by the substitution of machines for what was done hitherto solely by hand. In Great Britain the workmen that are thrown out of employment by the introduction of machinery are carefully provided for in almshouses. The population which lives in almshouses varies from 1,500,000 down to 400,000. The number of paupers in Great Britain is a sort of an index, an economical thermometer, so to speak, which shows the degree of prosperity found in the laboring classes of the community. When there are wars in existence the laboring class engaged in producing food, clothing, and shelter is smaller, having furnished a quota of its number for the army. On the other hand the Government is buying provisions and clothing in large quantities, and by means of these two causes the prices of provisions and clothing go up. The poor whose incomes have in a period of prosperity been barely sufficient to furnish food, clothing, and shelter, now find them insufficient, and a large margin of these poor people is transferred to the pauper list and receives what is called outdoor assistance, or perhaps full support, at the almshouse. During a period of peace it is noticeable that the number of paupers continues to diminish in Great Britain, and after a long period of peace it gets very low, only one-half or even one-fourth of the former number being found on the rolls of paupers.

This phenomenon can not be observed in the United States for two reasons. The first reason is that the great production of raw materials of food and clothing in the United States does much to make pauperism unnecessary. Secondly, the general education of the people in elementary schools makes the laborer more shifty or versatile, and he takes readily to the direction of machinery. When a useful invention makes his hand labor no longer remunerative he leaves his old vocation and takes up some other one, in most cases becoming a director of machinery. Both of these causes work in the United States to the result of making the number of paupers quite small.

This is the effect of a universal education in common schools. But besides versatility and the power to shift for oneself there is also aspiration. The majority of laborers look beyond their present calling and consider carefully how they can better themselves by engaging in a business that pays them better or a business that requires more intelligence. Common-school education causes aspiration in the laborer and makes him uneasy and restless. This seems to be a bad thing at first. But from another and a higher point of view it is well for the common laborer to aspire for something better. It is desirable that he should goad himself on toward a higher plane of production. The American laborer has thus obtained a reputation for his ability to shift for himself under new circumstances. There is a story told of the enterprising New Englander who by mistake took warming pans to Cuba where the temperature seldom goes below 70° F. The man is said to have turned his error to advantage by taking off the covers of his warming pans and selling them for molasses dippers. Stupid beginnings are sometimes made, but if the person has education he can get on to his feet some way. The four or five years of education amounting to eight hundred or one thousand days of instruction, all told, as an average for the American people, gives them the ability to easily change their vocations and find new ones as circumstances require. The phenomenon was illustrated in the twenty prosperous years between 1870 and 1890, when one-fifth of the farmers left their vocation and took up the various branches of manufacturing and commerce.

It is significant in this connection to note the great increase of high schools in the United States. The high school includes the children who are working at the course of study laid out for the ninth to twelfth years of work. Eight years are occupied to complete the course in the elementary school and four years to complete the course in the high school. High schools have increased in the United States until the total number is now 5,315, while nine years ago it was only 2,526. Not only the cities, but also the villages are all getting public high schools so as to instruct all the children who can be spared from their homes to obtain a secondary education, which includes the ninth, tenth, eleventh, and twelfth years of the course of study. It is noteworthy that natural philosophy (often called physics) and chemistry form a large part of the secondary course of study. Natural philosophy enables the boy or girl to understand the nature of force and the construction of machines which turn force to useful purposes.

MANUAL TRAINING IN PUBLIC SCHOOLS.

Within the last few years manual training has been introduced to some extent into the public schools, and quite a number of remarkable schools have been founded in different parts of the country to teach industries. I give herewith a

list in detail of these institutions in the United States from my latest report, which shows the number of pupils in each branch of industry—cooking, blacksmithing, carpentering, sewing, etc. These special schools are founded for the purpose of taking the place of the shiftless methods of apprenticeship. The school differs from apprenticeship by laying a solid basis in science and arithmetic. It enables the pupil not only to understand the machine, but to invent a better one if needed. Even a little smattering of science and geometry is a great help to the pupil. Although the number of industrial schools is quite limited, being only 125, yet it is rapidly increasing, as ten years ago it was only 18.

Number of cities of 3,000 population and over in each State, in which manual training was given in the public schools.

SCHOOLS FOR MANUAL AND INDUSTRIAL TRAINING.

Manual training is by no means a novelty in American schools. Thomas Jefferson recommended it for the students of the University of Virginia, and Benjamin Franklin included it in his plan for an academy in Philadelphia. An active propaganda was carried on in behalf of manual labor in educational institutions for many years, beginning about 1830, and some of our foremost institutions had their origin under its influence.

But what is now known as "manual training" is traced to an exhibit of a Russian institution at the Centennial in 1876. The value of the system of hand training there suggested was recognized by such men as Louis D. Runkle and C. M. Woodward, who became advocates of the new idea and introduced it into the institution under their charge.

Strong opposition was met among schoolmen for a time, but manual training has steadily grown in popularity, and with growth it has constantly improved in matter and method, and consequently in usefulness.

In 1899 manual training was an essential feature in the public-school course of 170 cities. In 359 institutions other than city schools there is training which takes more or less of the nature of manual training and which belongs in a general way to the same movement. These institutions embrace almost every class known to American education, and the manual features vary from the purely educational manual training of the Teachers' College in New York City to the direct trade instruction of the apprentice schools.

In many cases the legislatures have taken cognizance of the movement. Massachusetts requires every city of 200,000 inhabitants to maintain high-school manu-

training courses approved by the State board of education; Maine authorizes any city or town to provide instruction in industrial or mechanical drawing to pupils over 15 years of age; industrial training is authorized by general laws in Connecticut, Georgia, Indiana (in cities of over 100,000 population), New Jersey, New York, Utah, Wisconsin, and Wyoming. Congressional appropriations are regularly made for manual training in the District of Columbia.

In the report of this office for the year 1893-94 a chapter was devoted to the statistics of manual and industrial training, pages 2093 to 2169. To the same Report Prof. C. M. Woodward, director of the Manual Training School of Washington University, St. Louis, Mo., contributed a chapter on "The rise and progress of manual training," pages 877 to 949. In the 1895-96 Report, pages 1001 to 1152, is an examination of the courses of instruction in typical institutions offering manual or industrial training.

In the following pages is printed a list of the leading manual-training schools in the United States with their statistics for the scholastic year 1898-99. The first table gives the statistics of 101 manual and industrial training schools and 24 industrial schools for Indian children reporting to this office. In the 101 manual and industrial training schools there were 815 teachers, 432 males and 383 females. These schools had 33,257 pupils in industrial and manual training, 19,926 males and 13,331 females. The amount of money paid to teachers in 78 of these schools was \$548,892; the amount spent for materials by 65 of the schools was \$70,077; the amount spent by 55 schools for new tools and repairs was \$44,527; the amount for incidentals for 40 schools was \$51,120, and the total expenditure reported by 79 of the 101 schools was \$714,616.

In the 24 Indian schools there were 262 teachers, 116 males and 146 females; 5,364 pupils, 3,076 males and 2,288 females. The amount paid to teachers was \$127,586 for 18 of the schools, and the total expenditure for the same schools was \$198,834.

In the fourth column of the table the grade of literary instruction in each school is indicated. More than 40 of the 101 institutions are of high-school grade. The literary instruction in 9 of the Indian schools is also of secondary grade.

The second table gives for each school a statement in detail showing the number of pupils in each branch of manual or industrial training, the number of instructors in each branch, and the number of weeks devoted to each subject during the entire course.

Cities in which manual training (other than drawing) was given in the public schools in 1898-99.

1897....	Iowa	do	
1897....	South Dakota	School corporation	

Q. (By Mr. FARQUHAR.) On the question of conveyance of children to school, tuition, and text-books at public expense, would the results thus obtained reimburse the taxpayer for the otherwise loss by reason of nonattendance on the school? In what States is the conveyance of children to school provided for by legislation, and the State leading in the movement?—A. The free transportation of pupils to well-graded schools in the center of the town began less than thirty years ago, and within the last four years the movement has spread rapidly to other parts of the United States.

I offer the following statistical information, showing the States in which the plan has been adopted and other items of interest. The plan has the advantage that it gives a better grade of instruction to the pupils at a smaller cost than the former plan:

Free transportation of pupils.

Since.	State.	By—	Remarks.
1869....	Massachusetts.....	Town	Not exceeding 25 per cent of the school money.
1888....	Vermont	do	
1891....	New Hampshire.....	do	Do.
1893....	Connecticut	do	Discontinuing small school.
1893....	Maine	do	Do.
1894....	New Jersey	District	Unable to attend because living remote.
1895....	Ohio	Town	In certain counties only by special laws.
1896....	New York	District	To other district or city. ¹
1897....	Iowa	School corporation	For economy and advantage.
1897....	Nebraska	District	To other districts. ^a
1897....	Pennsylvania.....	do	For those made distant by closing small school and not above cost of small school.
1897....	South Dakota	do	Living at an unreasonable distance
1897....	Wisconsin	do	Living distant 1½ miles.
1898....	Rhode Island	Town	In practice earlier.
1899....	North Dakota	District	By two-thirds of votes cast.

¹ Especially for grades higher than in the home school.

Appended are extracts from the report of the committee of twelve on rural schools to the National Educational Association, July 9, 1895.

The first extract is from the report of the subcommittee on instruction and discipline.

"It was Massachusetts that led the way in developing the district system, and it is Massachusetts that is leading the way in consolidation. An act that dates from 1869 authorizes any town in the Commonwealth to raise money by taxation to enable the school committee, in its discretion, to provide for the conveyance of pupils to and from the public schools at public cost. The towns were already empowered to build schoolhouses wherever they were really needed. Availing themselves of these powers, many towns have entered upon the work of consolidating their schools. How the work goes on is shown by the following table.

GENERAL AND INDUSTRIAL EDUCATION.

exhibiting the sums of money paid for public-school transportation for certain of years:

Year.	Amount.	Year.	Amount.
1888-89	\$22, 118. 38	1892-93	\$50, 590. 41
1889-90	24, 145. 12	1893-94	63, 617. 68
1890-91	30, 648. 64	1894-95	76, 608. 29
1891-92	38, 726. 07	1895-96	91, 136. 11

"The movement has extended beyond Massachusetts and reached every one of the New England States. In these States many hundreds of schools have been consolidated, and with the most gratifying results. Occasionally an unsuccessful experiment is reported, but the great stream of testimony runs strongly the other way. Longer school terms, better teachers, better grading, better instruction, more interest in the pupils, greater physical comfort on the part of the children, better supervision—these are the claims that are made for the new departure. Other things being equal, the new way is never more expensive than the old one, and often it is less expensive.

"The movement has spread beyond New England. In 1894 a law was enacted in New Jersey providing for the transportation of pupils at public expense, in order that rural schools might be consolidated with city ones. A most interesting experiment in consolidation is being tried in northeastern Ohio, where some schools had already died out and many more were lingering on the verge of death. Permissive legislation has been obtained in several counties, and already many townships are working the plan successfully, while many others are looking on expectantly and are apparently on the point of making the new departure. The newspapers are quick to note the innovation, and it is already attracting attention beyond the borders of the State.

"The distinct pedagogical advantages of consolidation are much more fully set forth in the reports on supply of teachers and instruction and discipline than here. In this report the topic is dealt with mainly as it is related to organization and administration. The fact is, however, the several aspects of consolidation are inseparably connected. As a rule, whatever promotes simplicity and ease of administration promotes good instruction, and vice versa. No one of the subcommittees that handle the subject for a moment supposes that there is any charm in the word "consolidation" to cast all the evil spirits out of the rural school, but they all believe, after giving the subject mature consideration, that great possibilities of improvement lie in that direction. It is perfectly true that the consolidation remedy can not be universally applied, because physical and social conditions often forbid. The fact is that a large proportion of the children of the land will be schooled in little schools—rural schools, ungraded schools—or they will not be schooled at all. Suggestions looking to the improvement of these schools will be found in the reports of all the subcommittees, but insistence is here placed upon the fact that the consolidation remedy can be applied on a grand scale, with the largest promise of success.

"In most States some new legislation will be necessary to that end, but not in all. Wherever the township-unit system exists the first step, and the long step, has already been taken. In such States it should not be difficult to secure the needed legislation in relation to transportation. State Superintendent Emery, of Wisconsin, has already notified the people of his State that the laws contain all the provisions that are necessary to enable them to move at once in the direction of school consolidation.

"It is important that the consolidation reform shall not be misunderstood. It does not necessarily mean that there shall be only one school in a town or township. It does not mean either that parts of different townships or counties shall not be comprised in one school. These questions are merely matters of detail, and their adjustment will depend upon such factors as the size of townships, the distribution of villages or other local centers, the direction and condition of roads, streams, and bridges, the distribution of population, and the physical configuration of the township and the adjacent parts of the country. * * *

"It is noteworthy, let it be remarked again, how different social elements tend to attract one another and so to coalesce. School consolidation, especially its practicability, turns largely upon means of cheap, safe, and easy communication throughout the school area. Here we touch a question intimately relating to

social progress that has been receiving increasing attention the last few years. Reference is made to the improvement of roads. Those who have been promoting this movement have not probably regarded it as a measure of educational reform; but such it is. Perhaps there is no rural interest of a social nature that would be more decidedly enhanced by good roads than the educational interest. The people of some of the towns of Ohio, where the new plan is being tried, claim this as a decided advantage, that the drivers of the omnibuses serve as carriers for the mails between the farmhouses and the post-offices, thus promoting the diffusion of intelligence in still another way."

The second extract is from the report of the subcommittee on maintenance:

"Transportation to central schools.—The collection of pupils into larger units than the district school furnishes may be accomplished under favorable circumstances by transporting at State or local expense all the pupils of the small rural districts to a central graded school and abolishing the small ungraded school. This is the radical and effective measure which is to do great good in many sections of each State. As shown already by the subcommittee on the maintenance of schools, Massachusetts, in which the plan began under the town superintendent of Concord, Mr. John B. Tileston (about the year 1878 in Concord, or even earlier in the town of Quincy), paid in 1894-95 the sum of \$76,608 for the transportation of children from small rural schools to central graded schools—213 towns out of a total of 353 towns and cities using this plan to a greater or less extent, and securing the twofold result of economy in money and the substitution of graded for ungraded schools. The spread of this plan to Maine, Vermont, New Hampshire, Connecticut, Rhode Island, New Jersey, Ohio, and some other States (see Report of Bureau of Education for 1894-95, pp. 1469-1482) demonstrates its practicability. Experiments with this plan have already suggested improvements, as in the Kingsville experiment in Ohio, where the transportation reached in all cases the homes of the pupils, and yet reduced the cost of tuition from \$22.75 to \$12.25 a year for each of the 50 pupils brought to the central school from the outlying districts.

"Improvement of roads.—Wherever this plan of abolishing the small ungraded school is practicable it is by far the best remedy to be applied.

"But there will remain large numbers of small ungraded rural schools in which the plan of transportation is not feasible by reason of great distances and poor roads. The Agricultural Department is seconding the efforts of many States to improve roads in rural districts. In many places road improvement is a necessary condition previous to the betterment of rural schools."

Massachusetts, Ohio, and some other States have provided for the transportation of pupils from sparsely settled districts to the large schools in villages centrally situated. It is found that the cost of transportation is more than saved by the amount saved in wages of teachers, fewer teachers being able to do better work under the new plan than the more numerous teachers under the old plan.

Q. (By Mr. C. J. HARRIS.) What is the local transportation—taking them to the school?—A. Yes; the children are transported in a covered conveyance, a sort of omnibus, which is called in the towns in Massachusetts a "barge," which goes to the remote parts of the district and takes up the children in the morning, conveys them to school, and returns them to their residences in the afternoon at the close of school.

Q. (By Mr. SMYTH.) Have you no statistics or information relative to the education of negroes in the South? Have you any suggestion to make to the commission for technical or manual schools for the colored population? Is it not a more important education than high schools? Is it better suited for that race—technical education?—A. The increase of children in colored schools in the South since 1876 is shown in a table which follows. In 1876 less than 600,000 negro children were enrolled in the South Atlantic and the South Central States. The past year the number has risen to 1,511,618. There are remarkable schools for the training of colored teachers, especially at Hampton, Va.; Atlanta, Ga.; Claflin University, in South Carolina; Fiske University, at Nashville, Tenn.

The aggregate amount paid from public taxes for colored education in the Southern States during the past twenty-six years is about \$100,000,000. The increase in enrollment in colored schools has been in excess of the increase in population. So, too, has the enrollment of white children in the South. The amount of public money expended for education of both races in the year 1899 was \$32,849,892.

I should certainly say that it is desirable to increase technical and manual training schools for the colored population of the South, but I would not disparage the education in the ordinary branches of the high schools which, as I have stated, deal with mathematics, natural philosophy, and other branches of physical science, and languages. The language studies help to give an insight into human nature and to make a government by public opinion possible. The mathematics and natural sciences help to conquer nature and to give industrial ability. The total number of colored students in the high schools of the South amounts to something over 15,000, and the total in colleges and higher education, including the secondary education in their preparatory departments, is 43,430. About 2,000 of the students are in the old-fashioned classical course of study, learning languages and mathematics chiefly. The number in scientific courses is 1,326, while the number of students in what are called the branches of English education is 10,343. Fourteen thousand one hundred and fifty-three colored pupils are receiving industrial training. It is seen that 1,356 of these are learning farm work, 1,473 are learning carpentry, a little over 500 are learning blacksmithing, machine work, and work in metals, 628 are learning printing, 7,747 are learning sewing, and 2,218 learning cooking. I think that special pains should be taken to encourage industrial training throughout the South, not only in the colored schools but in the white schools, for the manufactures that are springing up at every village center in the South need skilled labor, and there is a surplus population not needed on the farms which should be drawn into the mills. Doubtless inventions will be made such as will reduce the hand labor necessary to cultivating and harvesting the staple crops. This will cause a readjustment of vocations and the increase of labor in manufactures and commerce.

The question of overproduction comes up frequently in dealing with this question of the transfer of labor from the production of raw material to the vocations of manufacturing and commerce. What is the exact proportion of the different industries so adjusted that there will be no overproduction or underproduction? It is obvious at the outset that any given industry now in existence may be made to overproduce by transferring all the labor of the community into that particular field, and by that transfer all of the other industries would be undersupplied. It is possible in a community to furnish more raw material than is needed in that community. When that is the case, it is desirable that some of the labor should be transferred from the production of raw material to its manufacture and exchange. But, again, by such transfer the laborers who produce the necessities in food, clothing, and shelter (the goods that are cheap and durable) may produce more than is needed in that sphere. But there is a class of manufactures, the list of which is always growing larger, which provides articles of creature comfort, and besides these there is labor which tends to the protection of the community in health and in the safety of person and property. Thus, as fast as the laborers can be spared from the production of the raw material and from the manufacture of the necessary articles in clothing and shelter, they enter the occupations that relate to amusement and recreation, and the profession of medicine; all these deal with the protection of health; and besides these occupations they enter upon the legal profession, the insurance of goods, insurance against fire, and against accidents and death, these things being devoted to the protection of property and life. Besides these, the officials managing public works, and those who administer public charities, and the officers of the government of the people (these occupations, too, dealing with protection) increase and multiply. Besides these two general classes of occupations which relate first to luxury and creature comfort and require a higher order of educated, technical skill, and secondly, to the means of protection, there is a higher order of occupations which have to do with the moral and religious culture, the intellectual education of the people, the trades that supply ornament on useful goods and make the works of fine art, or occupations that deal with the collection and diffusion of information, the editing and printing of books, the operating of the telegraph, and, lastly, the pursuit of science and the invention of devices useful in the arts. I have already quoted freely from an article in which I have described this transfer of laborers from the production of necessities to the industries that deal with creature comfort, protection, and culture.

What I have said regarding the education of the colored race holds with reference to the education of the Indians. The Indian has had hitherto the tribal form of civilization. The defect of the tribe is that it does not permit the rise of combinations large enough to give free development to productive industry, and it does not permit the ownership of land in severalty. Major Pratt's Indian school at Carlisle teaches the Indian to desire individual ownership of farms and shops, and to specialize his industry in shoemaking, the making of harnesses, the cooking of food, the making of clothing, and the building of houses.

I have already presented in a separate table the noteworthy industrial schools in the different parts of the United States, showing not only the numbers of students but the branches of study pursued. I would here call attention to the importance of good teachers in this new experiment of teaching industries. If the schools are to furnish students well equipped to enter the fields of labor, it is necessary that the teachers understand how to combine science with the arts; how to make the pupil understand the reasons for the knacks and technicalities of the trades. At present we have few teachers who can teach the arts and trades as well as the great mass of teachers can teach arithmetic, reading, and geography.

Q. (By Mr. C. J. HARRIS.) Is not the old system of apprenticeship the best system of manual training they can get; get so much schooling and then go in as an apprentice?—A. I am not quite prepared to say that the apprentice system remains to this date the best system of learning. I think that in many of the arts the school gives a much better instruction, and that as soon as the teachers of the arts and industries have learned how to teach their specialties in progressive lessons, just as arithmetic is taught, they will far excel the best forms of apprenticeship. The just complaint against the apprentice system is that the employer naturally wishes to get as much as he can out of the apprentice and hold him as long as he can in his service. He therefore holds back from the pupil a knowledge of the higher secrets of the trade and does not give him the finishing touch. He keeps the apprentice at work on the drudgery of the trade too long, and often the apprentice is not helped at all to acquire the highest skill. It is a different thing in a school. The individual is praised and rewarded for his efforts to master the most difficult processes of the trade, and it hastens the pupils as fast as their capacity will permit. From year to year new cities are building manual training schools and trade schools, and it will by and by become possible for any person who has earned a little money to leave his regular work and take a portion of a year or a whole year for better preparation in some trade school. This will assist very much the transfer of the best laborers from the production of raw material and the coarser manufactures into spheres where the highest skill is required and paid a much higher remuneration. In the article to which I referred a moment ago, showing this transfer of laborers, it is noted that in the twenty years from 1870 to 1890 the classes of labor which require more directive power and more skill increased very much faster than the population. For instance, designers and draftsmen and inventors increased from 104 in 1,000,000 to four times that number in each 1,000,000 of the population. Chemists and metallurgists increased to three times the number in each 1,000,000, journalists doubled, printers, compositors, and lithographers went up from about 3,000 in 1,000,000 to nearly 5,000 in 1,000,000; while, on the other hand, the mere blacksmith, the man of all work, decreased from 11,000 in 1,000,000 to 9,000 in 1,000,000, and the specialized workers in iron and steel increased from 14,000 to 21,000 in 1,000,000. Workers in stoves and furnaces, upholstery, paper hanging, plumbers, makers of pottery, painters, and glaziers, makers of clocks and watches, increased from 9,000 in 1,000,000 to 16,000 in 1,000,000. Besides this there was a large increase of people engaged in managing street railroads and steam railroads and in the transfer of passengers by other conveyances, so that while in 1870 there were 22,000 in each 1,000,000, in 1890 there were over 38,000 in each 1,000,000. There was certainly a vast improvement in the dwelling houses in the same period, so that each person is able with the wages that he receives now to obtain far more and far better house room.

I have mentioned already the increase of high schools in the United States. Last May I made a comparative table showing the increase of higher education in colleges, universities, and technical schools, and discovered, to my surprise, that in twenty-five years, between 1872 and 1897, the number of students in the colleges alone, omitting professional and technical students, had increased from 590 in 1,000,000 to 1,210 in 1,000,000, and that the number of college students pursuing special investigations with a view to increase a scientific knowledge in special provinces had increased from less than 200 in 1,000,000 in 1872 up to 5,000 in 1,000,000 in 1897. This class of students, it is well known, is a class of students that furnishes the most useful inventions and devices not only for manu-

factures but for the problems of city life that relate to the public health and the management of waterworks, gas works, the purifying of the slums, and such matters.

I. Number of college students to each 1,000,000 persons in the United States (excluding professional and technical students, but including post-graduate students):

1872	590
1873	740
1874	760
1875	740
1876	720
1877	710
1878	790
1879	780
1880	780
1881	760
1882-83	740
1883-84	750
1884-85	760
1885-86	700
1886-87	710
1887-88	710
1888-89	750
1889-90	880
1890-91	930
1891-92	1,020
1892-93	1,080
1893-94	1,140
1894-95	1,190
1895-96	1,220
1896-97	1,210

II. The following table shows the number of post-graduate students in the universities and colleges of the United States each year for twenty-five years:

1871-72	198
1872-73	219
1873-74	283
1874-75	369

1875-76	399
1876-77	389
1877-78	414
1878-79	465
1879-80	411
1880-81	400
1882-83	522
1883-84	778
1884-85	869
1885-86	935
1886-87	1,237
1887-88	1,290
1888-89	1,343
1889-90	1,717
1890-91	2,131
1891-92	2,499
1892-93	2,851
1893-94	3,493
1894-95	3,999
1895-96	4,363
1896-97	4,919

III. Number of professional students to each 1,000,000 persons in the United States:

1872	280
1876	380
1881	440
1885-86	450
1890-91	570
1895-96	740

IV. Students in scientific and technical courses in the United States:

1889-90	14,869
1890-91	15,586
1891-92	17,012
1892-93	20,829
1893-94	23,254
1894-95	24,055
1895-96	23,598

It is significant that the people of the United States as a whole have increasing faith in the higher education in colleges, that in the short period of twenty-five years the number sent by the people to these institutions should have more than doubled in each million of inhabitants.

Q. (By Mr. A. L. HARRIS.) You have in your department the statistics of present enrollment in different States, have you? Also by States, by divisions and States?—A. I give the tables here showing the enrollment of pupils in the different States in secondary schools and higher education, and the elementary and secondary together in a separate table.

Students in public and private normal schools and public and private high schools in 1898-99.

State or Territory.	Students in normal courses.				Secondary students.			
	Public normal schools.		Private normal schools.		Public high schools.		Private secondary schools.

a Including pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3. A classification of public and of private secondary students, according to the character of the institutions in which they are found, is given in Chap. XLI, vol. 2, Report of Commissioner of Education for 1898-99.

b This is made up from the returns of individual high schools to the Bureau, and is somewhat too small, as there are many secondary pupils outside the completely organized high schools whom there are no means of enumerating.

c Including colleges for women, agricultural and mechanical (land-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded, being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

d Mainly State universities and agricultural and mechanical colleges.

e Including schools of dentistry, pharmacy, and veterinary medicine.

f Mainly in schools or departments of medicine and law attached to State universities.

g Nonprofessional pupils in normal schools are included in columns 4 and 5.

h There are, in addition to this number, 25,307 students taking normal courses in universities, colleges, and public and private high schools.

It will be seen that the total number of different pupils enrolled on the school registers of the public schools alone for 1898-99 is 15,138,715, the same being 20½ per cent of the total population. I have already given a table showing the comparison of the United States with other countries in this matter of school enrollment as compared with the total population.

Amount of production in the State of Massachusetts.—Average for each inhabitant per day on the basis of 1880 and compared with school enrollment.—The total production of the labor of the people of the United States for 1880 was about 44 cents apiece per day for each man, woman, and child; but the production of Massachusetts with its average of seven years of schooling for each inhabitant was nearly double that of the average for each inhabitant of the whole nation. I have made on different bases three estimates, using the data given by Col. C. D. Wright in his census of the State for 1885. The lowest estimate gives 68 per cent more than the national average, the second 84 per cent, the third and best one exactly 100 per cent. The population of Massachusetts is 4 per cent and its production is 8 per cent of that of the whole nation. Who that looks at modern productions of industry and considers how much of it is due to machinery, and considers further the dependence of machinery for its management on alert and educated intelligence, can fail to see the relation of the schools of Massachusetts to its phenomenal production of the items of wealth.

The virtue of prudence or productive industry insures the existence of other virtues, such as temperance and honesty. For the fact that the people of a State have arrived at the stage of political conscience that they attack not only the crime, but also its source, in such vice as intemperance, implies an advance also in regard to many virtues. And can not the well-kept schools claim a large share in producing these favorable moral conditions?

Q. (By Mr. A. L. HARRIS.) You spoke a moment ago about the manual-training schools. Do you know how many colleges in the United States have a farm on which the students of agriculture can learn the practical part of farming along with the scientific part?—A. I do not think that the agricultural colleges, with their model farms, are working exactly along the line that you indicate. They are doing excellent work in mathematics and science; they are studying agriculture, chemistry, and acquiring general ability for investigating, but I do not think that they are giving as much time as they ought to, or as much time as they will give to the so-called practical problems of agriculture in their own States. I think perhaps that they could do more service by devoting more of their time to a study of the methods used by the best farmers in their States. There is the matter of preparing goods for market and marketing the same. It seems to me that a study of the methods employed by the most successful farmers would create in the minds of the agricultural pupils an ideal standard as to the best methods in this respect. A study of the methods employed for improving crops and improving the character of live stock, studying meanwhile the methods in actual use in the State, would produce fruitful results. The inventory of the successful farmers and the best farms, the best methods and the greatest results, the study of the causes of these things, would be very profitable to the students of the agricultural colleges and would certainly lead to great progress in the States. There is great difference between the study of chemistry by means of a text-book and the same by means of a laboratory. There is a great difference between the study of the general theory of a subject and a study of its application in one's own neighborhood.

Q. (By Mr. PHILLIPS.) Speaking of higher education, have you any remarks to make in regard to female education in the last twenty-five years?—A. The education of women in institutions of higher learning has been revolutionized in the past 25 years. The education of women in colleges has increased greatly the number of active minds who are investigating all sorts of problems belonging to sociology. The following table will give some idea of this increase:

Women college students in colleges and seminaries for women and in coeducational colleges.

[From reports of Commissioner of Education.]

1874	14,768	1887-88	18,548
1875	12,807	1888-89	20,759
1876	13,845	1889-90	20,843
1877	15,333	1890-91	22,001
1878	16,213	1891-92	28,381

1882-83	17,493	1895-96	32,234
1883-84	19,326	1896-97	32,472
1884-85	17,439	1897-98	34,040
1885-86		1898-99	37,606
1886-87			

The higher education of women has tended to displace men in certain employments. It is a matter of common observation that women are taking up their quota of clerkships. This displacement is nowhere more noticeable than in education, which now shows for 1897, out of a whole number of 403,333 teachers in the public schools of the country, only 32.6 per cent of male teachers, 271,947 being women teachers. I have already considered above in many places the question of readjustment of vocation. What is the effect of putting one class of laborers out of employment? The laborers displaced seek other employments. If they are well educated they give themselves to the acquirement of some new skill in a higher employment than they had before. In fact, in a prosperous period of business, such as existed between 1880 and 1890, the higher grades of occupation increase and expand. Capital seeks investment and moves into the higher spheres of labor, and makes its draft on the population for the most skillful and versatile of the laborers to enter the new occupations.

I give here a list of occupations that I have prepared, showing the lower order which produces a supply for necessities, and second, a higher order of two kinds, the first of which produces means of luxury, and the second the means of protection and culture.

List of occupations.

I. The lower order—production of necessities.

1. Procuring of raw materials.
 - (a) Agriculture and grazing.
 - (b) Hunting, fishing.
 - (c) Mining (including petroleum wells, etc.).
2. Transportation.
 - (a) Teaming.
 - (b) Railroad.
 - (c) Water transportation.
3. Transformation of products.
 - (a) Textile fabrics, cloth, and clothing.
 - (b) Wood and metal work.
 - (c) Leather.
 - (d) Miscellaneous.

II. The higher order—production of means of luxury, of protection, and of culture.

The vocations that provide:

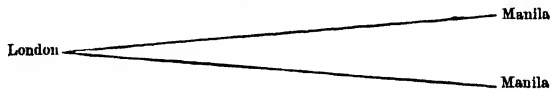

1. Means of luxury and creature comfort, including manufactures that require a higher order of educated technical skill.
2. Means of protection, including—
 - (a) Those who provide amusement and recreation.
 - (b) Medical profession.
 - (c) The legal profession.
 - (d) Officials managing public works or public charities, also Government officials.
 - (e) Insurance companies and the directive agents of companies formed for guarding the interests, general or special, of society as a whole, or of any particular part of it—charitable associations, trade unions, etc.
3. Instrumentalities of culture.
 - (a) Moral and religious—churches, etc.
 - (b) Intellectual and moral education—schools and libraries.
 - (c) Esthetic—including all trades that produce ornaments on useful goods or that produce works of art in sculpture, painting, music, poetry and literary art, landscape gardening, etc.; also all influences that cultivate taste—the formation and care of art museums, etc.
 - (d) The collection and diffusion of information, editing and printing of books and newspapers, telegraph operators, etc.
 - (e) Pursuit of science and the invention of devices useful in the arts.

PRESENT INDUSTRIAL PROBLEMS.

Q. (By Mr. FARQUHAR.) Do you think the more the working classes are educated and they begin to know their rights and privileges as members of the community more discontent comes among the classes and more irritation between capital and labor?—A. I certainly think that the working class in proportion as it becomes educated knows its rights and privileges as members of the community

and that more discontent is created and more irritation grows up between capital and labor. I think that the hatred of capital which prevails among many individuals of the laboring population is due to the fact that capital has not undertaken efficiently the political education of the laboring class. If capital showed in a simple and clear manner how its employment in the community for the promotion of manufactures and commerce cheapens the cost of the necessities and of the luxuries to all consumers, and that it makes the employment of the wage-earner more constant, and if it showed that the invention of machinery thereby increases the amount of productions of all kinds that can be purchased by the consumers, and also that it has rendered possible a change of vocations from the mere drudgery of producing raw materials or manufacturing coarse goods up to skilled industries wherein the wage-earner doubles and trebles his wages, I think that a more healthful popular opinion with regard to capital would come to exist in the minds of the workers. Capital owes it to itself to make its usefulness to the whole people as plain as a lesson in elementary arithmetic. It ought to teach, for one thing, the great service to the community of combinations made by that class of persons known as captains of industry. The creation of a railroad system, the cementing of it in all its parts into one whole, the adoption of very expensive rails, engines, and cars, the perfection of supervision over the whole so that it can reduce the cost of transportation of freight from $3\frac{1}{4}$ cents a mile per ton to one-seventh of that, or one-half a cent a mile per ton, is a prodigious benefit, showing its results in the enormous increase of value of farms in the Northwest, and, on the other hand, a corresponding decrease in the cost of the necessities of life in the city populations of the Atlantic coast. The invention of one man may be so greatly productive in this matter of a saving to the community that he may have added more than a billion of dollars to the wealth of the community while he has received one hundred millions for his own share. I presume that, as Mr. Farquhar suggests, capital in making its combinations often becomes careless of the condition of the workman and flatters itself that it may ignore the public opinion of the workmen of the United States. But capital certainly neglects its best interest when it comes to neglect the enlightenment of the laborer as to the actual function of large business combinations in the improvement of the condition of the people.

Q. Do you not think that the combination and concentration of capital still more aggravates this very feature of contention; that capital itself, when combined and concentrated, cares less for the condition of the working man and is better able to command the service of the employee than it would be if controlled by a greater number of capitalists?—A. I would say that Henry Carey, of Philadelphia, used to utter a very important truth in political economy when he said that we need more commerce and less trade. The more you can eliminate the middleman in commerce the more the producer gets for his raw material and the manufacturer gets for his labor and the less the consumer has to pay for the article in its final shape. A department store, for instance, by combining various lines of commerce, bringing them together in one building, is able to perform ten times as many exchanges as can be performed by separate stores using the same number of clerks. Commerce takes articles from where they are less useful and brings them to places where they are more useful. Large surpluses of goods in each community are worth nothing to that community, and would go to waste unless they could be transferred to another community where they are needed. Carey made a very interesting diagram. From a given point (call it London, for

instance) as the apex, draw two lines, one rising above the horizontal and the other descending below it in the same degree. The rising line represents the increased cost of manufactured products as we move away from cities and approach the verge of civilization. The lower line represents the falling price of raw material as we move toward the border land. As you go from the border land toward London, the central market of the world, you find your raw material increasing in value. On the other hand, you find the manufactured product decreasing in price. When you reach the central market of the world, you find manufactured products at their cheapest and raw materials at their highest price. This is a very instructive diagram.

Q. While labor-saving machinery has cheapened immensely the cost of what you would call the comforts of life—that is, clothing, etc.—for the working man, has it ever cheapened the necessities of life to the working man?—A. While

labor-saving machinery has cheapened immensely the cost of a great many manufactures and the imported articles of food and clothing, for the workman it has not cheapened the item of meat. Meat has continually increased in value in the markets of the world for the past three hundred years. This has been occasioned partly by the enormous increase in the consumption of meat by the people as a whole. But the other products of agriculture have not increased so much. The great staple grains, measured by a day's wages, have not increased. While varieties of agricultural products that are brought from a distance—say from the tropical regions around the world to the markets of our great cities—have enormously decreased in price, so that the workman has to pay higher for meat and about the same for grain and very much less for his tea, coffee, spices, tropical fruits, etc.

Q. Meat would be only one item. Is it not a fact, that in London, Paris, and New York, and the great centers, that the poor people pay four, five, or six hundred per cent when buying at the small retail marts more than ordinarily they would nearer the producing point of the necessities of life? Is not nearly the whole of their earnings eaten up by profits of the middleman?—A. I have no doubt that Mr. Farquhar is right in saying that the poor people in the cities pay five or six hundred per cent more for the articles of food because they buy it in small retail markets and pay the profits of a long series of middlemen, while their rich neighbors buy nearer, at wholesale prices, and pay much less for what they get. They pay a large proportion of their whole earnings to the middlemen. I have already discussed the cheapening of provisions by means of vast combinations of capital invested in railroads and the carrying trade. One of the most interesting tables to study in order to understand this subject is a table showing the amounts of each of the several products in the markets of the world arranged in such a manner as to show the actual amount of each used by the community. It is in a small book, a very valuable one, edited by Mr. Mulhall, called *The History of Prices*. He shows, on page 117, that the bread or the grain product of the world constitutes 25 per cent of the total expenses of the community, while meat is the next item, constituting barely 16 per cent. Iron and steel wares in the markets of the world occupy the next place and cost the community 7 per cent, while dairy products cost 6½ per cent, cotton goods less than 6 per cent. All manner of wood products cost a little more than 5 per cent, while woolen goods and beer cost about the same amount—namely, each 4 per cent of the entire expenses—coal 3½ per cent and leather the same, potatoes almost 3½ per cent, wine 2½ per cent, spirits 2½ per cent. For it is very important that we should consider the proportion of the elements entering into consumption in order to form a clear idea as to whether the cheapening of any one element of production has a great or a small effect on the whole. The cost of manufacturing has decreased and is decreasing continually by the introduction of steam, electricity, and improved machinery.

Q. John Stuart Mill, in his latest book on political economy, says: "It is questionable if all the mechanical inventions yet made have lightened the day's toil of any human being." Do you believe that statement?—A. John Stuart Mill says that mechanical inventions have not lightened the day's toil of any human being. This certainly is not in accordance with facts. When I was a youth, for two years of my life, I worked in a cotton mill 14 hours a day. The 14 hours permitted in 1844 have been reduced by legislation to 11 hours or 10 hours per day. Mr. Atkinson's little book on the distribution of products is a valuable source of information on this point. Mr. Atkinson, as you know, is a manufacturer, and presents the facts on this subject in a thoughtful and attractive manner. Moreover, the amount received per day by each laborer in manufactures is much higher in the day shortened to 10 or 11 hours than it was in the day of 14 hours.

In order to answer intelligently the question brought forward by Mr. Farquhar, I think it is important to have in mind the definition of civilization. Civilization has two important objects: The one is to place under the command of the individual and the social whole the services of nature, and the other function is the making available to each individual the lives of his fellow-men, so far as their experience is concerned and their observations upon nature, their reflections upon the facts of nature, and their insight into the laws by which nature is governed. Not only this experience regarding nature, but the experience regarding the human life, the laws which make social combinations possible, insights which underlie morality, religion, and the philosophical view of the world. Civilization evidently relates to a material side and to a spiritual side. If we compare John Stuart Mill's time with our own, we shall find an enormous advance in the command of the material world by machinery and the forces of steam and electricity, but we shall find a much greater progress through the agency of the newspaper and

the book, reaping for each person the results of the mental activity of all his fellow-men. It may be that the men of the present time work as hard as the men of the last century, but every hour's labor now produces from four to ten times as much result as each hour did then. Two hundred years ago the power of an individual citizen was very small in the way of participating in the life and work of his fellow-men; now it is comparatively great.

Q. (By A. L. HARRIS.) Then you think the condition of the workingman is better to-day than it was 50 years ago?—A. The condition of the workingman is now far better than it was 50 years ago, because he can command more productions that are useful for his health and comfort than he could then, and what is far better, he can share the observations and reflections of his fellow-men upon the problems of life.

CRIME AND PAUPERISM.

Q. (By Mr. SMYTH.) Do you believe that crime and pauperism are on the decrease in the United States instead of on the increase?—A. Pauperism is on the decrease in all the States which have a proper division of labor between agriculture, manufactures, and commerce. But the standard of poverty has been raised, and that class of persons who were obliged to shift for themselves 50 years ago now receive more or less aid from the public. So it is with regard to crime; the basis has changed somewhat; formerly the grosser kind of crimes were more frequent and little account was taken of many crimes which now are pursued with severity. The list of crimes has been increased by transferring many offenses from the list of vices tolerated by society, such as drunkenness, for example, over to the list of punishable offenses. To illustrate this I quote the following sentences from a paper of mine describing this apparent increase of crime in Massachusetts:

"To those who have objected to secular education as tending to fill our jails with educated criminals, the defenders of the schools have pointed significantly to the statistics of religious education among criminals which are beginning to be kept in a great number of jails and prisons. For instance, in the Detroit jail in 25 years there were reported 37,089 out of 40,838 as having religious training, against 2,349 who had none. Of the religious influences, 15 had been under Mormon training, 69 under Jewish, and the remaining 37,000 about equally under Protestants and Roman Catholic training.

"In the Elmira Reformatory in 12 years those reported as having no religious training were only 7 per cent; with Hebrew training, 5 per cent; with Protestant, 42 per cent; and with Catholic, 46 per cent.

"In the reports from 300 jails in the United States, with about 55,000 prisoners last year (1892), in reply to an inquiry made by the Bureau of Education, over one-half reported religious training of prisoners; 10,376 with none; 9,984 with Protestant; 163 with Jewish; 9,115 with Catholic training.

"I quote these facts to show how statistics may mislead a person who does not consider the qualitative as well as the quantitative side.

"It would be preposterous to think that the training of the church or the Sunday school could tend toward the production of criminals. The doctrine of self-sacrifice for others, the example of the Son of God who suffered, the perfect for the imperfect; no one can conceive a more powerful lesson to restrain the youth from a criminal career. The Jewish instruction in the Ten Commandments would produce righteousness instead of crime. And yet the neophyte in statistics would say that the 92 per cent of criminals in Detroit who have received religious instruction made a bad showing for religious education. But he would say this only because he is a neophyte and omitted his denominator, like the bad arithmeticians who have been decrying public education in the magazines and reviews and comparing numerators without a glance at their denominators.

"The religious statistics would read when the denominators are applied somewhat as follows: The 92 per cent of criminals who have had some religious instruction have been furnished by the 98 or 99 per cent of the whole population who have been under religious instruction, while the 8 per cent of criminals without previous religious teaching represent the 1 or 2 per cent of their class in Michigan. And none of the criminals came there through religious teaching, but because they neglected its counsels.

"The attack on school education as increasing the number of convicted criminals—an increase proved by the returns from the different States—has brought forward a new phase of the question.

"Educators will remember the brilliant attack, led by Richard Grant White, some years ago, in the *North American Review*, and recently an article in the *Popular Science Monthly*, by Mr. Reece. These have been replied to; the former

by Dr. Philbrick, in the *North American Review*, and by Prof. B. F. Tweed, in a valuable pamphlet; that of Mr. Reece was well answered by Mr. H. H. Clayton, who quoted the interesting analysis of criminal records in Massachusetts published by Mr. David C. Torrey, in *Lend a Hand*, for January, 1890.

"Massachusetts, it was said, committed to its jails and prisons only 8,761 persons in 1850, while in 1885 it committed 26,651, or nearly three times as many. In 1850, only 1 person to 113 inhabitants; in 1885, 1 to 72. This evidently demanded a qualitative inquiry! What crimes are on the increase? Mr. Torrey classified them, first, under two heads, and found that the crimes against person and property were, on an average, from 1865 to 1870, 1 to 301 inhabitants, while from 1880 to 1885 they were 1 to 436, thus showing a decrease in serious crimes of 44 per cent. The second heading was commitments for crimes against order and decency, and these had increased largely.

"Investigating further into these crimes against order and decency, Mr. Torrey found that they were mostly cases of drunkenness. The commitments for drunkenness in 1850 were only 3,341, while in 1885 they had risen to 18,701. The commitments for all other crimes than drunkenness in 1850 amounted to 1 for 183 inhabitants and in 1885 to only 1 for 244 inhabitants. The average from 1850 to 1865 was 1 to 174 inhabitants, while the average from 1870 to 1885 was 1 to 241 inhabitants for other crimes than drunkenness.

"This showing completely turned the tables on that class of sensational or emotional writers who deal with what I call hysterical statistics. Person and property have become more safe in Massachusetts. Between 1865 and 1885 commitments for crimes against them decreased 44 per cent. allowing for increase of population. The decrease was greatest in crimes against property, but there was a decided decrease of crimes against person. But while person and property have become safer in 25 years, drunkenness is not nearly so safe; the prisons and jails are crowded with intemperate people, who were formerly allowed to go unmolested through the streets and country roads.

"The fact that person and property have become more secure on the whole is very significant, when we consider the fact that the numerous cities of Massachusetts afford hiding places for burglars who raid on the small villages of the rural part of the State by night and escape to the city by railroad before morning. Any species of crime that goes unpunished tends to increase and to multiply criminals. Hence, rural districts in the vicinity of the large cities of the Middle and Eastern States suffer more from this species of marauding than any other portion of the United States, not even excepting the borderland.

"Of the secular virtues, justice is particularly concerned in this matter of crime. It has two phases, honesty and truth speaking, that are particularly cultivated in good schools. Temperance is a virtue which the school helps to some extent. Fortitude is developed by self-restraint in the school. Prudence or providence is the special virtue of thrift, and the school nurtures this by increasing intelligence and skill in productive industry."

Q. (By A. L. HARRIS.) I would like to ask whether you have any data in your office which show the legal course of study in the different parts of the States?—A. In regard to the question concerning the course of study fixed for the common schools in the several States, I would say that a compilation of the school laws of the several States has been made and published in my annual report for 1895, but I have not gathered the information from these laws into a separate account of the course of study. The course of study includes, in nearly all the States, reading, writing, arithmetic, grammar, history of the United States, miscellaneous lessons in natural science, and a course of lessons in hygiene, especially with reference to intoxicating drinks. I publish from year to year a table showing the studies of all the secondary pupils, those in the high schools and in private academies, showing how many are studying Latin, Greek, algebra, geometry. I will give a summary of the results for the past year in the following table:

Students in certain studies in secondary schools in 1898-99.

Studies.	In public high schools.		In private high schools and academies.	
	Number students.	Percent to total number secondary students.	Number students.	Percent to total number secondary students.
Students in				
Latin	239,981	50.39	51,714	49.80
Greek	14,858	3.12	9,918	9.65
French	37,817	7.94	24,106	23.15

History (other than United States)	182,196	38.32	39,791	38.32
Civics	101,637	21.97	16,566	15.95

Q. (By Mr. PHILLIPS.) I would be pleased to hear you on remedial legislation—industrial legislation—which has been raised by Major Farquhar and myself?—A. In reply to the question by Mr. Phillips as to remedial legislation, I think that general education is very important for the masses of the people, and perhaps sufficient for them; but there should be enough industrial schools to enable any person in the community to learn all that a school can teach regarding the main industry of his community, the working in wood and iron, in market gardening, and such matters as form the staples of industry. There are three classes of weaklings in society—the weakling in thrift, who produces pauperism; the weakling in morals, who is responsible for the production of crime, and, third, the weakling in intellect, who fills the asylums of the insane and feeble-minded. The weaklings of society need nurture more than they need justice. Justice imprisons them after they have broken the laws of the State. Nurture seeks them out, especially while of school age, and gives them special training with a view to make them useful instead of harmful to the community. The principle of civilization which comes to us from Rome makes competition the basis of individual success in life. This is a higher idea than communism or socialism, but it is not adapted to the weaklings of society. The third class of weaklings need the patriarchal form of civilization; they must not be given so much freedom as the normal class of citizens; they must be taken in hand by schools and by special organizations devoted to charity. The Roman competitive system is good for the highest development of the individuality of men, but it presupposes a basis of pride of character, ambition, and fortitude. Where there are only weaklings in thrift and morals (especially on the side of self-indulgence) and in intellect (the slums of great cities, for instance), the competitive system crushes rather than aids.

I have added a copy of the school laws of the several States, codified for the answer to the many questions which may arise regarding the adaptation of the school systems to their problems. It will be seen that there is a wide difference between the system as it exists in one State and that as it exists in another.

In answer to the second question (of Mr. Farquhar), I should say that the manual-training school, as it exists at present, is in an experimental stage. It is an important experiment, but it has not solved all of the problems, nor has it shown conclusively that the French and Belgian systems of special industrial schools is not preferable, on the whole. The most obvious reason in behalf of the manual-training school as it exists is that this is an age of machinery, and it is well to have each individual know something about woodwork and ironwork, and the art of cookery, for the sake of general intelligence as regards the management of machines. For this, knowledge of machines is useful every day; and a knowledge of cooking is a knowledge which makes palatable and nutritious the raw material of food which is apt to be wasted in a community where only a few of the women know how to make palatable and nutritious viands.

WASHINGTON, D. C., June 24, 1899.

TESTIMONY OF MR. A. C. TRUE,*Director of the Office of Experiment Stations, United States Department of Agriculture.*

The commission met at 11 a. m., Second Vice-Chairman Gardner presiding. Mr. A. C. True was sworn as a witness, and testified concerning agricultural experiment stations and colleges, as follows:

Q. (By Representative GARDNER.) Please state your name?—A. A. C. True.

Q. Occupation?—A. I am director of the office of experiment stations, United States Department of Agriculture.

I might say that under the call which I received to come before the commission I have prepared myself to speak especially on topics which are included under Nos. 23 and 24 of the commission's topical plan of inquiry on agriculture, technical education in agriculture, and the agricultural experiment stations, and I shall have something to say on the adaptation of the public school to the needs of the agricultural people. I take it for granted that as I proceed in my remarks members of the commission will put in questions wherever they desire special information, and if I am able I will give it.

Just a word as to my competency as a witness on these subjects: The office of experiment stations, with which I have been connected in various capacities since its foundation, is a sort of clearing house for agricultural education and experimentation in this country and abroad. We receive there the reports and bulletins of all the agricultural colleges and experiment stations and from many foreign countries, and we make a business of reviewing all that literature for the purpose of knowing its contents and publishing as much as may be of general advantage to our people in this country. Besides that, we have made, within recent years, personal visits to every part of the United States except our new island possessions, and also to many of the countries of Europe. I have been myself a number of times to all of the States and Territories in the United States except Alaska, and I have also visited Europe for the purpose of studying questions relating to agricultural education and experimentation. So that, in a general way, I think I am in a position to look at this matter broadly, and I hope I shall be able to bring out some information which will be of use to the commission.

First, let me call your attention to the fact that there has been within the last half century a great world-wide movement for the organization of technical education in agriculture and scientific research along agricultural lines. It is very important, I think, that our people should understand that the work we are doing in this country is simply a part of what is being done the world over, and that the great commercial nations, with which we are more and more coming in competition, are every year increasing their efforts to perfect their system of agricultural education and investigation.

The movement abroad, in some respects, has reached its highest perfection in France, Germany, and Belgium, where agricultural education has been quite thoroughly organized, and includes schools of different grades from the university down to the elementary school. And now such countries as Russia and Australia and Japan are developing quite complete systems of agricultural investigation and education, and even in countries that we have counted as among those that never move in progressive lines there is a movement in this direction. In Egypt there is at least one very well organized agricultural college, and in connection with it agricultural experiments are being carried on under competent direction. Recently the Sultan of Turkey has called on the Secretary of Agriculture to recommend some scientifically trained expert along agricultural lines who might advise him how to organize agricultural education and experimentation in the Turkish Empire.

In this line, as in other lines, we must always remember that we are meeting an ever-increasing tide of competition and that we can not afford to be behind the rest of the world in any way in the organization and perfecting of our schemes for technical education in agriculture and for scientific and practical experimenting in agricultural lines.

Coming now to the United States, we may say in general that we have three agencies for agricultural education and research. We have the agricultural colleges and schools, the agricultural experiment stations, and the United States Department of Agriculture. The United States Department of Agriculture is, in the main, a great agricultural experiment station, working along both the higher lines of scientific research and more practical lines, and giving out a large amount

of information for the benefit of the people. I thought that very likely the commission would call before it some representative of that Department who would speak particularly of its work, so it is my purpose not to say anything about it in detail to-day, but to confine myself to the system of agricultural education in this country and the agricultural experiment stations.

Briefly speaking, our system of agricultural education includes agricultural colleges, agricultural schools which are of a lower grade, the farmers' institutes, various plans of university extension, as it is now called, such as home reading circles and farmers' clubs, which pursue courses of study under the more or less direct supervision of the agricultural colleges; and besides that we have a movement, now rapidly gathering head, for the introduction of nature study into the rural schools, somewhat after the same plan as has been introduced into the city schools, but with a choice of subjects more directly relating to agriculture.

Speaking first of the agricultural colleges, they are organized under what is known as the land grant act of 1862. This is an act which is very broad in its scope, and for that reason the system of institutions which have grown up under it includes a wide range of colleges and universities, and much misapprehension has arisen in the public mind regarding these institutions because they are loosely classed together in the public press and otherwise, oftentimes, as agricultural colleges. Now, the fact is that in this country we have only one purely agricultural college, and that is located in the State of Massachusetts, at Amherst. In 27 States and Territories the colleges are organized as agricultural and mechanical colleges, not always having exactly that name, but they are colleges in which, along with agriculture, there are courses of instruction relating to the mechanical arts and other subjects like domestic science, and in many cases some shorter courses, so that in these 27 States you have institutions ranging all the way from those which have 2 or 3 courses of study to those which have 12 or 15 different courses of study.

Q. (By Representative LIVINGSTON.) How do you class the Mississippi College?—A. The Mississippi College is classed as agricultural and mechanical—that is, it has courses in agriculture and mechanic arts especially.

Then, in 20 States, these land-grant colleges are the State universities, in which there is a department or school of agriculture, but of course these State universities take in every subject that comes within the scope of education, as far as their means will permit. In all these institutions we have different kinds of courses for agriculture—the regular 4 years' college course, a shorter course, commonly of 2 years' duration, special courses, as in dairying, etc.—and there has been a great tendency, as far as the agricultural side of these institutions is concerned, within the past few years toward specialization, both in the dividing up of the subject of agriculture into different branches which are taught by different teachers, and in the offering of more special courses in different agricultural subjects; and this, I think, is strengthening the agricultural course and bringing it into line with the courses given in other subjects, and enabling it more fully to meet the needs of different classes of students.

You may be interested in one or two of these special lines of work. For instance, there is at the University of Wisconsin a special dairy school, which has already sent out about 800 trained butter and cheese makers, and has also taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at that institution a short course in agriculture which this year had 190 students in attendance. In this case they are working directly for the interests of the farm, as you will see by this statement which the dean of the college, Professor Henry, makes:

"We have found places on the farms this year for more than 50 young men, and 20 more will probably find employment within the next week. These young men secure from \$2 to \$5 or \$10 more per month because of their training with us."

Another instance of this special school work is in Louisiana, where a school for training sugar experts has been in operation for a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State University, that has proved useful and is meeting with outside approval and with the support and financial assistance of the Sugar Planters' Association.

We have in this country, at present, land-grant colleges in all the States and Territories except Alaska; and in some of the States, especially in the South, there are separate institutions for the colored people, so that the total number of such institutions, according to the statistics for 1898, collected by the office of experiment stations, was 64, of which 61 maintained courses in agriculture. They had, in all, resources of funds, lands still unsold, farms, buildings, apparatus, machinery, libraries, and miscellaneous equipment to a total value of something over

\$53,500,000, and the income of these institutions, derived from the land-grant act of 1862, from the United States appropriation under the act of 1890, from State appropriations, from fees, and from other sources made a total of a little over \$6,000,000. The value of the additions which were made to the buildings and the equipment of these institutions in the single year 1898 is estimated to be \$2,800,000, showing a large relative increase and indicating the strength which these institutions have in the public regard, because a large part of this money came from the State appropriations.

The number of persons teaching in these institutions was, in 1898, 2,611, and in the colleges of agriculture and mechanical arts 1,722 instructors were employed. The total number of students in these institutions in that year was reported to be 31,638, and, in the courses of agriculture alone, 4,181.

Now, it would not do to measure the influence of these institutions on agricultural education and the promotion of the intelligence of our farmers, by the instruction they give in exact facts regarding this art; it will not do to judge the influence of these colleges in that direction by the number of students in agriculture, because these institutions, as I shall try to show you a little later, are in many ways going out beyond the class room to exert a much wider influence on agricultural progress in this country. But I think it is something that we ought to note carefully as an encouraging feature that we have such a large number relatively of students who are actually pursuing college courses in agriculture, for we are thereby, it seems to me, doing a great work in training the men who are to be the leaders in agricultural progress. We are sending out every year a body of thoroughly trained young men along agricultural lines whose influence, without any doubt, will be very great in promoting the progress of agriculture in this country.

We will consider next the schools of agriculture of lower grade than the colleges, and here we shall find that we have simply the beginning of a movement. There is connected with the University of Minnesota a school of agriculture of high-school grade, having a course of study and a faculty organized separately from the college of agriculture in the university, and giving instruction of a distinctively lower grade. This school, last year, reported an attendance of 275 young men and 50 young women. It is also affirmed by the managers of this school that nearly all of its graduates returned to farm homes, and as one branch of that institution there is a dairy school, which has in attendance about 100 young men who have had some previous experience in butter and cheese manufacture, and who have come to get a more technical knowledge of this subject.

A similar school has recently been started in the University of Nebraska and this year has an attendance of 60 boys, reported to be directly from the farm and with the intention of going back to the farm. The schools for colored people, the Hampton Institute, in Virginia, and the Tuskegee Institute, in Alabama, under Booker T. Washington's wise management, of which we have all heard so much, are developing agricultural courses along these high school lines. Then we have a school under the Jewish auspices at Doylestown, Pa., endowed, as I understand it, by the Baron Hirsch fund to a considerable extent, which has a farm school on the European pattern, I should judge, though I have not had the privilege of visiting it. They take the boys to live on the farm and instruct them in agriculture along practical lines. I also understand that the Miller Manual Training School, in Virginia, gives some training in agriculture along this line. This, as I have stated, is only a beginning. In my judgment, every year shows more conclusively that we need in this country to develop secondary schools for agriculture as they have been developed to a considerable extent in the leading countries of Europe. Now, there are two ways in which I think this may well be done. I think we ought to have a number of special schools after the plan of those schools in Minnesota and Nebraska. They might be begun in connection with the land-grant colleges, but they ought to be extended so as to have a number of them at different points in different parts of the State. They can be run, of course, as secondary colleges at comparatively moderate cost and the expenses of the students can be made smaller than in the colleges, and they would be nearer to the students' homes; but even if that should be done, I think that in addition we should have the introduction of what I would call outline courses in the theory and practice of agriculture in the high schools in or near the rural communities. I do not think that our people outside of the cities fully understand that the cities are constantly developing their high schools along the lines of manual training and technical education. In Washington, for example, we have a business high school as a separate institution, and we are going to have a manual-training high school. In many high schools in the smaller cities, we have courses which directly relate to the various lines of business and industrial arts. Now, I think the same thing ought to be done for agriculture, and, in my judgment, it is a comparatively simple matter at least to make a begin-

of information for the benefit of the people. I thought that very likely the commission would call before it some representative of that Department who would speak particularly of its work, so it is my purpose not to say anything about it in detail to-day, but to confine myself to the system of agricultural education in this country and the agricultural experiment stations.

Briefly speaking, our system of agricultural education includes agricultural colleges, agricultural schools which are of a lower grade, the farmers' institutes, various plans of university extension, as it is now called, such as home reading circles and farmers' clubs, which pursue courses of study under the more or less direct supervision of the agricultural colleges; and besides that we have a movement, now rapidly gathering head, for the introduction of nature study into the rural schools, somewhat after the same plan as has been introduced into the city schools, but with a choice of subjects more directly relating to agriculture.

Speaking first of the agricultural colleges, they are organized under what is known as the land grant act of 1862. This is an act which is very broad in its scope, and for that reason the system of institutions which have grown up under it includes a wide range of colleges and universities, and much misapprehension has arisen in the public mind regarding these institutions because they are loosely classed together in the public press and otherwise, oftentimes, as agricultural colleges. Now, the fact is that in this country we have only one purely agricultural college, and that is located in the State of Massachusetts, at Amherst. In 27 States and Territories the colleges are organized as agricultural and mechanical colleges, not always having exactly that name, but they are colleges in which, along with agriculture, there are courses of instruction relating to the mechanical arts and other subjects like domestic science, and in many cases some shorter courses, so that in these 27 States you have institutions ranging all the way from those which have 2 or 3 courses of study to those which have 12 or 15 different courses of study.

Q. (By Representative LIVINGSTON.) How do you class the Mississippi College?—A. The Mississippi College is classed as agricultural and mechanical—that is, it has courses in agriculture and mechanic arts especially.

Then, in 20 States, these land-grant colleges are the State universities, in which there is a department or school of agriculture, but of course these State universities take in every subject that comes within the scope of education, as far as their means will permit. In all these institutions we have different kinds of courses for agriculture—the regular 4 years' college course, a shorter course, commonly of 2 years' duration, special courses, as in dairying, etc.—and there has been a great tendency, as far as the agricultural side of these institutions is concerned, within the past few years toward specialization, both in the dividing up of the subject of agriculture into different branches which are taught by different teachers, and in the offering of more special courses in different agricultural subjects; and this, I think, is strengthening the agricultural course and bringing it into line with the courses given in other subjects, and enabling it more fully to meet the needs of different classes of students.

You may be interested in one or two of these special lines of work. For instance, there is at the University of Wisconsin a special dairy school, which has already sent out about 800 trained butter and cheese makers, and has also taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at that institution a short course in agriculture which this year had 190 students in attendance. In this case they are working directly for the interests of the farm, as you will see by this statement which the dean of the college, Professor Henry, makes:

"We have found places on the farms this year for more than 50 young men, and 20 more will probably find employment within the next week. These young men secure from \$2 to \$5 or \$10 more per month because of their training with us."

Another instance of this special school work is in Louisiana, where a school for training sugar experts has been in operation for a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State University, that has proved useful and is meeting with outside approval and with the support and financial assistance of the Sugar Planters' Association.

We have in this country, at present, land-grant colleges in all the States and Territories except Alaska; and in some of the States, especially in the South, there are separate institutions for the colored people, so that the total number of such institutions, according to the statistics for 1898, collected by the office of experiment stations, was 64, of which 61 maintained courses in agriculture. They had, in all, resources of funds, lands still unsold, farms, buildings, apparatus, machinery, libraries, and miscellaneous equipment to a total value of something over

In Massachusetts 125 institutes are held, with an attendance of about 13,000 farmers.

In Minnesota 50 farmers' institutes of 2 or 3 days each are held, with an attendance of from 300 to 1,000 people at each institute, and 15,000 copies of their annual report are distributed.

In Indiana an attendance is reported of over 25,000, an average number of 272 persons in somewhat less than 100 institutes.

In Michigan institutes are held in nearly every county and the total attendance is reported to reach about 120,000.

In Pennsylvania some 200 institutes are held.

In Ohio 235 institutes in 88 counties were held, with an attendance of about 90,000.

In New York some 250 institutes are held in a single year.

Pass on, now, to consider briefly what may be called university extension work on behalf of the farmer, a part of which is included in what the colleges do for the farmers' institutes, as already shown.

We have an attempt in Pennsylvania and some other States to organize a regular course of home reading for farmers. The Pennsylvania State College was the first to do this in any thorough way, and its work may show what can be done in this line. They have at present enrolled at the Pennsylvania State College between 400 and 500 persons who are pursuing these courses at their own homes. A syllabus of the course is sent out to each of these persons and they are recommended to read certain books and asked to write answers to questions, and these answers as they come in, in many instances, show a surprising degree of proficiency. That work is growing rapidly, and it has already taxed the resources of the college to carry it on. Besides this, we have at times had what may be called traveling schools—that is, instead of the ordinary institutes, we have the instructors in the colleges and workers in the experiment stations going out and taking up some particular line of instruction for, say, 3 days, in a special locality, so that those in attendance get a little more systematic survey of the subject than at the ordinary institute through addresses. This is just in its beginning in this country, but has been attempted abroad to a considerable extent. For example, in England a number of traveling schools for dairying are put in operation each season. A dairy outfit of the modern kind is taken along on the train and on the cart finally, and the teacher in charge not only makes an address, but he shows how these instruments or apparatus are to be worked, and helps the farmer in this way to get an idea of the more modern methods.

Lastly, under the head of agricultural education, we will consider agriculture in the elementary schools. This has been undertaken in some European countries to quite an extent, but the outcome is as yet problematical. The one great difficulty thus far, as in this country, has been to find teachers who are properly trained for that kind of work, because it requires a special training and especial adaptability to succeed; and then the general demand for the introduction of new studies into the elementary schools growing out of the general broadening of human knowledge makes it a very difficult matter to determine how far any special subject like agriculture can be safely and wisely introduced into the common schools. In some cases it is done with considerable success abroad. I remember, for instance, going myself to a school in a little village in Belgium, where the teacher, as in Europe in such schools is almost universal, was a man, who was that day giving instruction on milk to children 12 and 14 years of age. He was doing it in good shape, and they were much interested, and trying to get out of it all they could. They told me he was a very unusual man. His whole soul was in his work. He was secretary of an agricultural club of the village, and he was trying to introduce a modern dairy, besides his onerous duties as general schoolmaster. He was one out of a thousand. That shows that under some circumstances, at least, something can be done in this line, but, generally speaking, I do not myself believe that the formal teaching of agriculture can be introduced into the common schools, and that seems to me to be certainly true under the present condition of our common schools. What we need to do now is to reform our country schools along the modern lines of elementary instruction, just as we have the city schools, and we shall be busy for some years to come in getting the common schools into as good condition along these lines as they ought to be. One thing which can be done, and which will have considerable bearing on agriculture, is to introduce into the common schools the teaching of nature, to use a phrase that is becoming common—that is, to have the teachers in these schools as a part of their regular work lead the scholars to observe the natural objects and phenomena about them, and thus to get a start along the line of modern thought relating to science, and to see in an elementary way how this

of information for the benefit of the people. I thought that very likely the commission would call before it some representative of that Department who would speak particularly of its work, so it is my purpose not to say anything about it in detail to-day, but to confine myself to the system of agricultural education in this country and the agricultural experiment stations.

Briefly speaking, our system of agricultural education includes agricultural colleges, agricultural schools which are of a lower grade, the farmers' institutes, various plans of university extension, as it is now called, such as home reading circles and farmers' clubs, which pursue courses of study under the more or less direct supervision of the agricultural colleges; and besides that we have a movement, now rapidly gathering head, for the introduction of nature study into the rural schools, somewhat after the same plan as has been introduced into the city schools, but with a choice of subjects more directly relating to agriculture.

Speaking first of the agricultural colleges, they are organized under what is known as the land grant act of 1862. This is an act which is very broad in its scope, and for that reason the system of institutions which have grown up under it includes a wide range of colleges and universities, and much misapprehension has arisen in the public mind regarding these institutions because they are loosely classed together in the public press and otherwise, oftentimes, as agricultural colleges. Now, the fact is that in this country we have only one purely agricultural college, and that is located in the State of Massachusetts, at Amherst. In 27 States and Territories the colleges are organized as agricultural and mechanical colleges, not always having exactly that name, but they are colleges in which, along with agriculture, there are courses of instruction relating to the mechanical arts and other subjects like domestic science, and in many cases some shorter courses, so that in these 27 States you have institutions ranging all the way from those which have 2 or 3 courses of study to those which have 12 or 15 different courses of study.

Q. (By Representative LIVINGSTON.) How do you class the Mississippi College?—A. The Mississippi College is classed as agricultural and mechanical—that is, it has courses in agriculture and mechanic arts especially.

Then, in 20 States, these land-grant colleges are the State universities, in which there is a department or school of agriculture, but of course these State universities take in every subject that comes within the scope of education, as far as their means will permit. In all these institutions we have different kinds of courses for agriculture—the regular 4 years' college course, a shorter course, commonly of 2 years' duration, special courses, as in dairying, etc.—and there has been a great tendency, as far as the agricultural side of these institutions is concerned, within the past few years toward specialization, both in the dividing up of the subject of agriculture into different branches which are taught by different teachers, and in the offering of more special courses in different agricultural subjects; and this, I think, is strengthening the agricultural course and bringing it into line with the courses given in other subjects, and enabling it more fully to meet the needs of different classes of students.

You may be interested in one or two of these special lines of work. For instance, there is at the University of Wisconsin a special dairy school, which has already sent out about 800 trained butter and cheese makers, and has also taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at that institution a short course in agriculture which this year had 190 students in attendance. In this case they are working directly for the interests of the farm, as you will see by this statement which the dean of the college, Professor Henry, makes:

"We have found places on the farms this year for more than 50 young men, and 20 more will probably find employment within the next week. These young men secure from \$2 to \$5 or \$10 more per month because of their training with us."

Another instance of this special school work is in Louisiana, where a school for training sugar experts has been in operation for a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State University, that has proved useful and is meeting with outside approval and with the support and financial assistance of the Sugar Planters' Association.

We have in this country, at present, land-grant colleges in all the States and Territories except Alaska; and in some of the States, especially in the South, there are separate institutions for the colored people, so that the total number of such institutions, according to the statistics for 1898, collected by the office of experiment stations, was 64, of which 61 maintained courses in agriculture. They had, in all, resources of funds, lands still unsold, farms, buildings, apparatus, machinery, libraries, and miscellaneous equipment to a total value of something over

of the State are so prominent. I have no doubt in the high school in Des Moines there are quite a large number of students who have come from the rural schools to finish their education. It would then be very appropriate, in such a school as that, that an optional course should be formed in agriculture for the benefit of these students. They could do it without any considerable expense, because, as I said, they already have at least one teacher who is equipped along scientific lines, and if they got a teacher from some agricultural college he would know just as much science, and he would be able to give instruction in agriculture besides.

Q. (By Mr. FARQUHAR.) Will you please state the substance of the law of 1862, the land-grant act?—A. It is a law which granted each State and Territory 30,000 acres of land for each Representative or Senator in Congress, the proceeds from the sale of which were to constitute a fund to be held by the State and devoted to the maintenance of colleges in which agriculture and the mechanic arts would be taught, but in which other subjects, not even excluding the classics, might be taught.

Q. Do you recollect which State first took advantage of the act?—A. I do not. Colleges have been organized in all the States and Territories which could take advantage of the act.

Q. Before the act of 1862 how many States had what we call State agricultural colleges?—A. Only a very few. The college of Michigan was the first college established, I think, in 1855; Maryland had made some movement in that direction; Pennsylvania likewise, and so in possibly 10 or 12 States there had been a movement.

Q. In the early part of your discourse you mentioned that France, Germany, and Belgium had made great advances in agricultural education; why do you except Great Britain?—A. Great Britain has been backward in that respect. She has no thoroughly organized agricultural education or experimentation. There are a few agricultural colleges; and she has in recent years given grants of money to a number of institutions, but there is no regular system. She is behind, but she is beginning to wake up to see, as in regard to technical education generally, that this is one of the problems in England nowadays.

Q. I suppose in Great Britain—if they have not organized systems of agricultural education, how do you account for the fact that the farmers are able to pay £3 to £5 rental annually and get crops off that pay them? This is a practical view, independent of the educational features, is it not?—A. I should say, in large measure, that is due to the market right at hand—at their doors. England has imported a very large portion of her agricultural material of all sorts, but along lines which call for intensive farming, market gardening, and, to a certain extent, the raising of fine stock and industries which require a large amount of practical skill, patience, and systematic effort, her farmers have the advantage, though it is not certain how long they will retain that advantage. I should judge from what I read they do not feel secure in that position.

Q. The point is this, you say that Great Britain has not systematized its education in agriculture, and yet practically this result we know, that farmers raising cereals in Great Britain pay rent from \$15 to \$25 per acre annually and make it pay. How does the British farmer learn these scientific principles?—A. He has learned through long years of the necessity for careful culture, and then he has taken advantage to a considerable extent. I would judge, of the information which has been given him through what has been done on the continent of Europe. You will find that the reports of the experiment stations in France, Germany, and Belgium are being constantly translated and made available to the English farmer. Much valuable information has also been given him by the experiment station at Rothamsted, in his own country, which has been at work over 50 years. But, on the other hand, in some things he has not been able to hold his own altogether. The farmer in Denmark, who took up with the scientific side of dairying and with the help of his Government organized the business of dairying on a scientific basis, has been able to go into the English market with his butter and drive out, to a certain extent, the Englishman himself. The Danish butter, I understand, is rated higher than any other butter on the English market.

Q. And so with respect to Canadian cheese. I do not think the Canadians are very far advanced in agricultural education, but Canadian cheese can sell in Liverpool and London markets against the best Dunlop.—A. But in Canada there has been of recent years very systematic and thorough work in agricultural education and investigation. They have an admirable system.

Q. I thought in Canada, on account of the sparseness of population, it would be difficult to bring education in among the Canadian farmers?—A. I do not mean

of information for the benefit of the people. I thought that very likely the commission would call before it some representative of that Department who would speak particularly of its work, so it is my purpose not to say anything about it in detail to-day, but to confine myself to the system of agricultural education in this country and the agricultural experiment stations.

Briefly speaking, our system of agricultural education includes agricultural colleges, agricultural schools which are of a lower grade, the farmers' institutes, various plans of university extension, as it is now called, such as home reading circles and farmers' clubs, which pursue courses of study under the more or less direct supervision of the agricultural colleges; and besides that we have a movement, now rapidly gathering head, for the introduction of nature study into the rural schools, somewhat after the same plan as has been introduced into the city schools, but with a choice of subjects more directly relating to agriculture.

Speaking first of the agricultural colleges, they are organized under what is known as the land grant act of 1862. This is an act which is very broad in its scope, and for that reason the system of institutions which have grown up under it includes a wide range of colleges and universities, and much misapprehension has arisen in the public mind regarding these institutions because they are loosely classed together in the public press and otherwise, oftentimes, as agricultural colleges. Now, the fact is that in this country we have only one purely agricultural college, and that is located in the State of Massachusetts, at Amherst. In 27 States and Territories the colleges are organized as agricultural and mechanical colleges, not always having exactly that name, but they are colleges in which, along with agriculture, there are courses of instruction relating to the mechanical arts and other subjects like domestic science, and in many cases some shorter courses, so that in these 27 States you have institutions ranging all the way from those which have 2 or 3 courses of study to those which have 12 or 15 different courses of study.

Q. (By Representative LIVINGSTON.) How do you class the Mississippi College?—A. The Mississippi College is classed as agricultural and mechanical—that is, it has courses in agriculture and mechanic arts especially.

Then, in 20 States, these land-grant colleges are the State universities, in which there is a department or school of agriculture, but of course these State universities take in every subject that comes within the scope of education, as far as their means will permit. In all these institutions we have different kinds of courses for agriculture—the regular 4 years' college course, a shorter course, commonly of 2 years' duration, special courses, as in dairying, etc.—and there has been a great tendency, as far as the agricultural side of these institutions is concerned, within the past few years toward specialization, both in the dividing up of the subject of agriculture into different branches which are taught by different teachers, and in the offering of more special courses in different agricultural subjects; and this, I think, is strengthening the agricultural course and bringing it into line with the courses given in other subjects, and enabling it more fully to meet the needs of different classes of students.

You may be interested in one or two of these special lines of work. For instance, there is at the University of Wisconsin a special dairy school, which has already sent out about 800 trained butter and cheese makers, and has also taught between 1,000 and 2,000 young men butter making on the farm as distinguished from that in the creamery. There is also at that institution a short course in agriculture which this year had 190 students in attendance. In this case they are working directly for the interests of the farm, as you will see by this statement which the dean of the college, Professor Henry, makes:

"We have found places on the farms this year for more than 50 young men, and 20 more will probably find employment within the next week. These young men secure from \$2 to \$5 or \$10 more per month because of their training with us."

Another instance of this special school work is in Louisiana, where a school for training sugar experts has been in operation for a number of years at Audubon Park, New Orleans, in connection with the experiment station, and more recently at Baton Rouge, in connection with the State University, that has proved useful and is meeting with outside approval and with the support and financial assistance of the Sugar Planters' Association.

We have in this country, at present, land-grant colleges in all the States and Territories except Alaska; and in some of the States, especially in the South, there are separate institutions for the colored people, so that the total number of such institutions, according to the statistics for 1898, collected by the office of experiment stations, was 64, of which 61 maintained courses in agriculture. They had, in all, resources of funds, lands still unsold, farms, buildings, apparatus, machinery, libraries, and miscellaneous equipment to a total value of something over

It was my purpose, if there are no further questions, to take up now the agricultural experiment stations, about which I have not said anything material thus far. Experimenting along agricultural lines began in this country in a regular way with the establishment of agricultural colleges, but it was only organized definitely as an experiment-station movement just about 25 years ago, when the first regularly organized experiment station was started in the State of Connecticut. About the same time a similar thing was done in California, and stations began to be formed here and there in other States, until in 1887 we had 17 experiment stations in 14 different States. In that year Congress passed what is known commonly as the Hatch act, which gave to each State and Territory annually \$15,000 a year for the maintenance of an experiment station, which, as a rule, must be in connection with a land-grant college. The only exception is in those States which had State experiment stations organized before the passage of this act. Now, these early stations were largely occupied in organizing the control of commercial fertilizers and demonstrating the necessity of the usefulness of basing the purchase of such fertilizers on the manufacturers' guaranty of their chemical composition, but the stations made also sufficient scientific investigations to indicate that with broadened facilities and resources they might render much more service to the agriculture of the country. The work of organizing new stations under the Hatch act was therefore taken up with enthusiasm, and they were soon in operation in every State and Territory. The basis for this rapid development of experiment-station work had been laid by the agricultural colleges previously established under the land grant act of 1863 in most of the States and Territories. As the Hatch act made the stations departments of these colleges, it was comparatively easy to find in their faculties men competent to undertake agricultural investigations, while their buildings, scientific apparatus, and farms furnished a sufficient equipment to make it possible to begin experimental inquiries as soon as the funds for their maintenance were provided. The lines of work had already been marked out to a considerable extent by kindred institutions in Europe, by our older stations, and by the United States Department of Agriculture, which already contained within itself a great experiment station through the work of its different scientific divisions. The method of publishing accounts of agricultural investigations through widely distributed reports and bulletins containing the scientific and technical details of the work or concise summaries of its practical results had already been established. It was possible, therefore, for the stations organized under the Hatch act almost immediately to undertake useful investigations and to begin the publication of information based on systematic observations and experiments.

During the past 10 years more than \$10,000,000 has been expended in the maintenance of the experiment stations in the United States. Of this sum about \$7,000,000 came from the Federal Government and \$3,000,000 from State sources. This seems, perhaps, a very large sum to expend for agricultural investigations, but it will not appear unduly so if we bear in mind that during the same period the United States produced agricultural products valued at \$30,000,000,000; in other words, we have spent \$1 in the effort to improve our agriculture and increase the output for every \$3,000 of product, which I think you will say is not a very large sum to expend in that way.

The number of publications of these stations, including 3,000 bulletins and 500 annual reports and exclusive of press bulletins, has reached 3,500. The bulletins of the stations are now regularly sent to more than 500,000 farmers, and it is estimated that about 5,000,000 copies of these publications are now annually distributed. This, I may say, is in addition to the distribution of between 6,000,000 and 7,000,000 copies of documents from the Department of Agriculture.

The experiment stations are conducting a wide range of scientific research in the laboratory and plant house and an equally large amount of practical experimenting in the field, the orchard, stable, and dairy. Practically all the stations are keeping a record of meteorological data, while 9 are making special studies of problems relating to meteorological phenomena and climatic conditions. Twenty-four stations are at work upon soil investigations, its geology, physics, and chemistry, or conducting soil tests with fertilizers, or in other ways. Sixteen stations are studying questions relating to drainage and seepage or to irrigation in the field or greenhouse, and with orchard, garden, or farm crops. Forty-eight stations are making analyses of commercial and home-made fertilizers or are conducting field experiments with fertilizers. At least 17 stations either exercise a fertilizer control in their respective States or make analyses on which the control is based. All stations are studying the more important crops, either with regard to their composition, nutritive value, methods of manuring and cultivation, and

the best varieties adapted to individual localities, or with reference to systems of rotation. Thirty-six stations are investigating the composition of feeding stuffs and, in some instances, making digestion experiments. Thirty-seven stations are conducting feeding experiments for milk, beef, mutton, or pork, or are studying different methods of feeding. Twenty-five stations are investigating subjects relating to dairying, including the chemistry and bacteria of milk, creaming, butter making, or the construction and management of creameries. Fifty-two stations are doing chemical work and 37 are studying methods of analysis. Botanical studies occupy more or less of the attention of 37 stations, including investigations in systematic and physiological botany with special reference to the diseases of plants, testing of seeds with reference to their vitality and purity, classification of weeds, and methods for their eradication. Forty stations work to a greater or less extent in horticulture, testing varieties of vegetables and large and small fruits, and making studies in varietal improvement and synonymy. Several stations have begun operations in forestry. Thirty-four stations investigate injurious insects with reference to their restriction or destruction. Nineteen stations study animal diseases and the methods for their prevention or cure. At least 5 stations are engaged in bee culture and 7 in experiments with poultry. One or more stations have made investigations on miscellaneous subjects, such as the following: Technology of wine and of olive oil, bleaching of nuts, preservation of fruits and vegetables, gaseous fermentation of canned goods, draft tests of farm implements, road-making experiments, cane, sorghum, and maple-sugar experiments, oyster culture, etc.

That summary is, I think, enough to indicate something of the breadth on which our stations are organized. We may classify their duties roughly under 4 general heads: *a*, they take part in certain police duties such as are connected with the control of fertilizer inspection, of dairy products, etc.; *b*, they study the natural conditions and resources of the State by making something of a survey of the soil, of the plants, etc.; *c*, they conduct demonstration experiments in which they show how things, which have been worked out by science or through practical experiments can be adapted to local conditions; and then, finally, *d*, they conduct scientific investigations with reference to finding out new truths and new applications of old principles. The stations are now organized in all the States and Territories under this Hatch act of March 2, 1887, and work has been begun in Alaska under the direct supervision of the Department of Agriculture through the office of experiment stations. We have a very successful experiment station in operation in the Hawaiian Islands under private auspices, but having for its director a man formerly connected with the Department of Agriculture and the Louisiana experiment station.

Separate stations are supported in some of the States, so that the total number of stations in the United States is 54, not counting branch stations, of which there are a number. Of these, 52 receive the appropriation provided for in the act of Congress above mentioned. The total income of these stations for the fiscal year 1898 was a little over \$1,200,000, of which \$720,000 was given from the national Treasury; the remainder, nearly \$500,000, came from State sources.

Q. (By Senator MALLORY.) Is there any revenue at all from the experiment stations?—A. Yes; they get from their farms a small revenue. I have noted that the sales of farm products of the stations in 1898 in the United States amounted to \$65,356.25. Of course we can not experiment to make money, and can not expect to turn in much.

In addition to this, the Office of Experiment Stations had an appropriation of \$35,000 for its work last year, which included \$5,000 for the Alaskan investigation. The stations added to their equipment in 1898 buildings, libraries, apparatus, implements, live stock, etc., to the value of over \$176,000.

There were employed in 1898 669 persons in the work of administration and inquiry, divided as follows: 75 directors, 148 chemists, 71 agriculturists, 10 experts in animal husbandry, 77 horticulturists, 29 farm foremen, 21 dairymen, 50 botanists, 46 etymologists, 26 veterinarians, 20 meteorologists, 11 biologists, 11 physicists, 6 geologists, 19 mycologists and bacteriologists, 7 irrigation engineers, 15 in charge of substations, 23 secretaries and treasurers, 10 librarians, 46 clerks. There are also 21 persons classified under the head of "Miscellaneous," including superintendents of gardens and buildings, apiarists, herdsmen, etc. 305 of the station officers do more or less teaching in the colleges with which the stations are connected.

During 1898 the stations published 406 annual reports and bulletins. Besides regular reports and bulletins a number of the stations issued press bulletins, which were widely reproduced in the agricultural county papers. The mailing

lists of the stations now aggregate half a million names. Correspondence with farmers steadily increases and calls on station officers for public addresses at institutes and other meetings of farmers are more numerous each year. The station officers continue to contribute many articles on special topics to agricultural and scientific journals. A number of books on agricultural subjects, written by station officers, have been published during the last year.

The individual stations are brought into intimate relations with each other and are made to constitute organic parts of a great national system of agricultural research through two general agencies—the Association of American Agricultural Colleges and Experiment Stations and the Office of Experiment Stations of the United States Department of Agriculture.

The Association of Colleges and Stations holds annual meetings in different parts of the country, at which questions of general policy and management of the stations are discussed and papers on special topics connected with the work of the stations are read. The proceedings of this association are published by the Department of Agriculture. The next meeting will be held at San Francisco on the 5th of July, 1899.

The Office of Experiment Stations, organized in October, 1888, in the Department of Agriculture, examines the work and expenditures of all the stations, publishes popular and technical summaries of their investigation, collects and disseminates information regarding the work of similar institutions throughout the world, suggests lines of inquiry, aids in cooperative enterprises, and in general aims to assist the stations in developing and strengthening their work. Since its establishment this office has published 10 volumes of the Experiment Station Record, comprising over 100 numbers or 10,000 pages, over 60 bulletins, about 40 Farmers' Bulletins, and a card index of Experiment Station Literature, aggregating some 18,000 cards. Nearly 1,000,000 copies of the publications of this office alone are distributed during one year.

The American experiment station as it exists to-day is the most complete and comprehensive system of agricultural research which the world has ever known. Its publications reach farther and come home more closely to great masses of our farmers than is the case in any other country. If any farmer in the United States is not acquainted with the latest information which agricultural science has to give him regarding the means for improving his art, it is because he has neglected to avail himself of the public agencies created for his benefit.

I will speak now of some of the results of the station work under separate heads:

As to what stations have done to defend the farmer against fraud: The stations largely, especially those east of the Mississippi River, have been engaged in the investigation and inspection of commercial fertilizers under State laws. The fertilizer business involves millions of dollars and the stations have largely prevented the sale of fraudulent goods. In the State of New York alone, over 900 brands of fertilizers were examined during 1898 and even then the station did not get around with its work. In Connecticut, where the inspection has been very efficient, the business amounts to a million dollars in the year, while in Pennsylvania it is estimated it has reached \$4,000,000.

The stations have also done much to expose extravagant claims for fertilizers, showing the advantage of farm manures, cotton seed, etc., and instructing farmers how to mix their own fertilizers; and by testing the varieties of grain, vegetables, fruits, etc., the stations have warned farmers against extravagant claims for new varieties. Other matters inspected by the stations are nursery stock for fungus diseases and insect pests; seeds, adulterated food, especially dairy products, butter increasers and preservatives, concentrated feeding stuffs; quack medicines for stock, especially hog-cholera remedies; they have also exposed frauds in creamery construction and equipment and dairy apparatus.

Then they have done much to remove obstacles to agricultural industries. A very large feature of this work has been the investigation of injurious insects and diseases of plants, the value of which is now very widely acknowledged; such important work as that on the rot of grapes, apple scab, San Jose scale, gypsy moth, potato rot, potato scab, smuts in wheat and other grains; of course the Department of Agriculture has shared in this as in many of these lines of work. It is hard to separate stations from the Department in such enterprises. By discovering an effective curd test the Wisconsin station has provided a means of detecting tainted or defective milk at cheese factories, a matter which has caused a loss of from \$100,000 to \$300,000 each summer in Wisconsin alone.

The agricultural colleges and stations have been largely instrumental in securing State laws for the inspection of fertilizers, nursery stock, dairy products,

falsified foods, and feeding stuffs, creamery glassware, paris green, and for the suppression of plant diseases and injurious insects. They have also aided in the passage of laws establishing farmers' institutes, fixing a milk standard, organizing associations for the promotion of agriculture, quarantining animals for contagious diseases, sale of oleomargarine, the apportionment and measurement of water for irrigation, State aid for highway improvement, etc.

Then they have aided in the development of existing methods, crops, or industries, in their several States. I can only give you a few examples of the work done in this line.

In Louisiana, by developing new methods in the sugarhouse, previous losses in sugar making were either reduced or entirely removed, and by improving the cultivation of sugar cane and the selection of new varieties the industry has been considerably helped; and the Sugar Planters' Association has recognized that by contributing to the support of the stations to a considerable extent.

In Connecticut the chemical studies and elaborate field experiments of the Connecticut State station, in cooperation with tobacco growers, have given very important results. The quality of the Connecticut wrapper-leaf tobacco has been decidedly improved and hence this tobacco commands higher prices than any Northern-grown wrapper leaf.

In New York the animal industry and dairying have been improved by investigations made by the New York State station on ensilage, waste products of manufactures for feeding stuffs, processes of cheese manufacture, and elaborate tests of dairy breeds.

In Missouri the investigations on the draft of wagons with broad tires have shown their advantage in nearly all conditions. This seems to be a thing which the League of American Wheelmen have thought a good deal of. They published a large edition of the station bulletin on the subject at their own expense.

In New York also the station connected with the Cornell University has made a very careful investigation on the care and preservation of farm manure and the effects of careful tillage.

The Connecticut Storrs station has been notable for its studies on the nutritive value and digestibility of forage crops; and it has carried on a large number of cooperative experiments with fertilizers, also cooperative experiments on the effect of nitrogenous food materials on milk production.

Ohio, by some feeding experiments, seems to have shown that much more stock food per acre can be secured in Ohio from corn than from sugar beets, and they have also had a good deal to do with showing the superiority of shallow over deep cultivation of corn on Ohio soils.

The Mississippi station has done a very important work for the South on the development of the growth of forage plants and the live-stock industries, along with which went a demonstration of the value of cotton seed and products for stock.

Of the stations in the irrigated regions we have an example in Utah, where important work has been done in improving the methods of tillage with special reference to the conservation of moisture, and by studies of alfalfa at different stages of growth, etc.

In Vermont we have special investigations on the chemistry and physiology of sap flow as related to the maple-sugar industry.

In California a large amount of work has been done in the distribution of seeds and plants of improved varieties, in helping the wine industry and the olive industry by investigations on the raising of grapes and olives, and in the making of wine and olive oil.

In Oklahoma effective investigations have been made on the culture of Kafir corn.

In Rhode Island there have been important investigations on the feeding and breeding of ducks and geese.

In Nebraska, the station has had a good deal to do with promoting the growing of alfalfa and winter wheat instead of spring wheat, by which the State has got to be a large producer of wheat, raising some 50,000,000 bushels in 1897. Its investigations of subsoiling in that region have been very important, and have resulted in increasing the yield of corn in some cases from 10 to 30 bushels per acre.

In Arkansas, some practical experiments on economical methods of producing pork and beef in connection with the raising of cotton, have been made with a special view to the improvement of the worn cotton soils.

Lastly, we come to the higher work of the stations, which relates to the new methods, crops, or industries introduced by the stations. There is time to give only a very few examples.

The Wisconsin station has been instrumental in introducing a variety of barley known as the Manshury barley. This increased the average yield several bushels per acre in Wisconsin with a result worth millions of dollars annually to the State alone. This station and the Minnesota station have been largely instrumental in introducing the growing of rape in these States, and it is now grown on thousands of farms to the advantage of the farmer. The Wisconsin station was fortunate enough, after several other stations had made imperfect successes, to perfect a reliable milk tester—the Babcock milk tester—and that has very largely revolutionized the business of dairying in this country.

The Pennsylvania station, and many other stations, have recently been engaged, as you doubtless know, in investigations on sugar beets. This together with what work the Department of Agriculture has done, has shown definitely where good beets for sugar can be grown, so that we do not need to work on that problem any more. The question of manufacture now remains for other people, working along economic and commercial lines.

The Maine station has shown that apples can be raised successfully in Aroostook County, and now thousands of barrels of apples are shipped out of that county annually.

Storrs station, in Connecticut, has made very important original investigations on problems connected with the nutrition of men and of animals, working out the apparatus and methods of experimenting, which can now be adapted to experiments with all sorts of farm animals, and the Department of Agriculture has recently taken up that work in Pennsylvania, and we are going further than anybody in Europe has gone in studying certain problems connected with the nutrition of men and domestic animals.

In Ohio a method of watering greenhouses by subirrigation has been originated, which it is claimed will largely increase the product and make the crops less subject to disease.

In Florida the introduction of the velvet bean seems to have been a great thing for the State, resulting in the saving of thousands of dollars on fertilizers. It can also be used as a forage crop. Individual orange growers say they save as much as \$1,000 annually by the use of the bean. Cassava is a new crop, and seems to be especially adapted to the sandy soil of Florida. One factory for the manufacture of starch from cassava has been built, and it seems that starch can be made quite cheaply from this plant.

The California station has been engaged in soil investigations, especially on alkali lands, and these have been along lines not previously attempted, and a great deal of information has been obtained, which has brought into agricultural use large tracts of land which before were thought to contain alkali in such proportions as to make them useless. This has been an important result.

Speaking of Kafir corn, which was introduced into Kansas by the Department of Agriculture and taken up by the Kansas station, in 1898 over a half million acres of this corn were grown on Kansas land, a value of about \$6,000,000.

Q. (By Representative GARDNER) Does it mature in Kansas all right?—A. I think so. I am speaking generally now; there may be localities where it will not. That is, of course, a dry-soil plant, and that is a great advantage for certain regions of Kansas.

Let me speak briefly of a few hindrances which the stations have in their work, but from which, however, they are yearly escaping more and more. There has been to a considerable extent a failure to understand the real purpose of the stations, and there has been disappointment that they have not undertaken, I might say, more farm operations. It should be borne in mind all the time that the act under which the stations are operating has been framed with reference to the needs primarily of institutions where science is to be used for the benefit of agriculture, so that the stations are to work, so to speak, from the scientific end to the practical, and not to carry on farming operations for the sake of showing what good farming is, after the manner of the model farm or anything of that sort. Ignorance of this fact has often been coupled with a failure to appreciate the needs and requirements of scientific work on behalf of agriculture, so that many have supposed that the workers in such institutions could engage very largely in outside work, such as lecturing, teaching, etc. Now, if the stations are to do their best work, the men engaged in them must give their time very fully to their investigations and must be allowed to pursue these investigations according to the methods demanded by the investigations, and must not be hampered by outside duties; and a failure to appreciate that by the people and boards of management has often hindered their work.

But there is a general hindrance due to political influence working too actively in the organization of these stations, and it is well that the people should understand

that and safeguard these institutions against it. In most of the States the board is appointed by the governor of the State, either with or without the consent of the legislature, and these boards have such terms of office that the membership can be more or less shifted for political purposes, and it has been done too largely. Of course every one can see that this is not the field in which political action is proper, safe, or wise.

Now I want to say in that connection that I am not one of those who take a narrow view of the field of political activity. I think there is a wide field where political influence may properly exert itself, but when it comes to the management of educational and scientific institutions it is impossible for me to see how we can have a good state of things until these institutions are completely rid of personal and political influences and considerations.

Then there have been, as a result of many causes, shifting policies in the management of these institutions, so that the officers have changed too frequently, and that has been a great hindrance to efficient work. We must have men who will stick to the work of agricultural experimenting long enough to accomplish the best work. Another difficulty arises from a lack of proper organization of the stations; the different workers have oftentimes been too independent of each other; at other times there has been too much meddling on the part of the board of management, who should confine their work to general matters. Then at the outset, and, to a considerable extent still, there is a lack of thoroughly trained men for this work. We are making this up every year, but that has been one of the difficulties. The haste for immediate results has been a considerable hindrance. As soon as the stations are established, farmers and others want something to show at once. In most lines of experimenting with which I am familiar we can not determine much in 1 year or 2 years. It takes time, and if you hurry the thing too much you spoil it; and, connected with that, there has been a demand for too many kinds of work. The stations have a certain amount of money, and there are all sorts of questions, a thousand problems in any State, and of course it is not wise for any one station to take up more than a few and work them up thoroughly; but the demand for a little work here and a little there has, in many cases, spread the work out too much.

On the other hand, there are many hopeful indications looking to the strengthening and improving of the work of the stations. Every year they have a better equipment and better trained men; they divide their work more thoroughly among specialists and introduce new lines of work in that way. Then there is being made yearly a clearer distinction between the educational work which the college can properly do and the experimental work which the station ought to do. Finally, we have in an increased measure the cordial support of Congress and State legislatures and the people. I think it is very remarkable how the appropriations for experiment work have been made in Congress without demurrers and how those of the State legislatures have been increased from year to year, evidently with the backing and approbation of the people; and there are many evidences that farmers and people generally approve the work of these stations.

Now, if I may be allowed to sum up in a few words the general results of the movement in this country for agricultural education and research, I would say first, that it has given us a body of trained leaders and experts, so that we are prepared as we have never been before for advanced work along these lines; secondly, we have an up-to-date American literature on American agriculture the like of which has never been seen. Reference has been made to the work done in England, and it is only a few years since we were compelled in this country to depend very largely on English works on agriculture for our agricultural literature. This was unfortunate in many ways; but now we have a literature of our own which is up to the times and from an American standpoint. As a part of this some 50 books have been published within the past few years whose authors are college and station men. Thirdly, there has been a free distribution of a vast amount of accurate and useful information. When you have made all the allowance that you can fairly make for crudity and misinformation which the station and Department publications may from time to time contain, you can still say that a very large amount of accurate and valuable information has been disseminated, and this has been more thoroughly done in the United States than it has been in any other country. This is a special feature of the work which our foreign friends comment upon when they come to have a knowledge of it. In the fourth place, I think we may fairly claim that the colleges and stations have been an important factor in breaking down the traditional opinion that agriculture is of necessity a nonprogressive art, and this is a work the effects of which will accumulate as the years go by. Fifth and lastly, they have been an important factor in making the state of the ignorant, shiftless, and nonprogressive

farmer worse than it used to be. I think this work is also cumulative, because it is becoming clearer every year that if a man is to be successful in agriculture, as in other arts, he must be progressive and seek up-to-date information and ideas.

Q. (By Senator MALLORY.) With reference to this movement of experiment stations, are any of these men appointed by the United States Government?—A. No. The experiment stations are State institutions, each under its local board.

Q. (By Representative GARDNER.) The distribution of the agricultural colleges over the country is shown in your statement, is it not?—A. Yes; generally.

Q. Is there one in every State?—A. Yes; one in every State; at least each has a college in which agriculture is taught.

Q. And an experiment station?—A. Yes.

BOSTON, MASS., July 20, 1899.

TESTIMONY OF MR. ELISHA WINTER,

Journalist, Boston, Mass.

At a meeting of the Subcommittee on Manufactures and General Business, held in Boston, Mass., on July 20, 1899, Chairman Smyth presiding, Mr. Elisha Winter appeared at 4.30 p. m. and, being duly sworn, testified as follows:

Q. (By Mr. SMYTH.) What is your occupation, Mr. Winter?—A. Journalist and salesman.

Q. If you have any statement to make to the commission we would be glad to hear you.—A. I feel highly honored by your courtesy and I will not impose upon it to any great extent. I had a talk here this morning with your chairman and other members, and I realize that my position is very radical, and I have toned it down to some extent, in respect to your judgment, and have tried to make it as conservative as I can; but I do feel on the question very radically. I have spent some years of study and observation, and have some considerable information on the subject of technical education for the American people. I have been all over the United States, and wherever I have been for the last few years I have been looking at that subject very carefully with a view of applying technical education to every pursuit.

The German Government, as you know, has done more in the way of applying technical education to every pursuit than any other nation in the world. It is well known that they have made great progress. It is admitted in the British Parliament to-day that Germany is in danger of supplanting Great Britain on account of having so seriously devoted her time to technical education. In the German army they train a man in everything, down to shoeing a horse; they give as much attention to one thing as another; they take a man and make the most of him; that is the German idea of the "Fatherland." He gives himself, satisfied that the Government will make the most of him. I have seen Germans come to this country from the potato field and they surely supplant the average immigrant that comes to this country. They are well educated and carefully trained, and they are developed as no other class of men I have had an opportunity to study.

I do not attribute it to the nationality entirely. I do not attribute it to any other one thing than their superior education. My observation of the German and the Frenchman, too, to some extent, is that their law has given them a superior system of education to ours. We have been doing grandly for the time we have been in existence, but have something to learn from Europe. I am a strong advocate of the nation-aided system of applying technology to every pursuit. The State authority, as I look at it, is too limited in regard to education. We have no standard of education. We are now practically an imperialistic republic, and are taking on the character of an empire in our administration of subject races. We are assuming new responsibilities and meeting new problems. I maintain our standard of education needs to be changed to meet these new problems. The United States must recognize this responsibility and act. Napoleon Bonaparte was the first man to appreciate this idea of national responsibility on the subject of education. He found at the close of the French Revolution that men in the machine shops and in the department of artillery could do a thing themselves but they could not teach another man to do it. He thought it was a mistake, and set to work and taught men to design; taught them to speak with their hands as well as with their tongues, and then a man could make up a design and hand to another man, and that man could go and execute it. The German Govern-

ment at the time of the Franco-German war was a discordant combination of conservative provincial States, and as a result of that great war they formed a great German Empire, and they immediately applied the enormous sum of money which they received from France in developing their form of government, took up the educational system and through Bismarck's policy made a great advance and formed what is a magnificent empire. It has been applied by other nations, and we are, in this country, making an application of technology; but ours is the only nation that does not recognize its responsibility as a nation in seeing that its people are educated, and I suppose it is on account of our form of government.

Education was practically in the hands of the theologians and philosophers until early in the dawn of this century. Technology developed first among the professions of law, theology, and medicine. It is only within the last fifty years that it has reached commerce and the trades. In France, the university at Paris has a laboratory attached to every professor's chair. This nation needs such a university established at Washington by act of Congress. Of course we will never get it. Our federal form of government is largely responsible for our having no national minister of education, and no national recognition of any national educational responsibility, except in the case of the Indian, to which we probably must soon add the Filipino and the Cuban.

Is it not better and cheaper to adopt so much of Germany's standard as can be applied here, instead of having to send our young men to Germany to finish their education? Let our National Government bring the German professor over here. As we have had to import skilled labor in other things why not import the skilled labor in educational institutions?

At the time of the civil war we depended upon Russia's idea to give us the Massachusetts Institute of Technology, and the Russian system to-day is carried out in this country to a large extent. We have appropriated very much of their system of railroads, civil engineering, and military schools; but we have not done much when we think of what Europe has done for the needs of education. Europe educates the intelligent few and neglects the masses. We educate the masses and leave the intelligent few to get their education from either private endowment or by going to Europe for it, where education is often obtained at the expense of patriotism.

Technical education succeeds in Europe because the government furnishes it. This country is becoming more and more of an empire and less and less of a republic. With this transformation in our form of government we must, of sheer necessity, change our theory of education. We need in our consular service, among our commercial travelers, and in our productive and distributive transactions a technical skill which no power but our National Government can furnish.

James Bryce, in his *American Commonwealth*, gives this critical analysis of the public elementary school: "The public elementary school gives everybody the key of knowledge in making reading and writing familiar, but it has no time to tell how to use the key." And he adds, "That the education of the masses is a superficial knowledge, goes without saying."

In the United States the only class trained for their work are those in the professions, constituting but about 5 per cent of the whole. Twenty per cent are classified as commercial, leaving 70 per cent as needing industrial and scientific training. The salaries paid in commercial and business pursuits average as follows: 5 per cent at \$2,000 per annum; 12 per cent at \$1,200 per annum; 28 per cent at \$1,000 per annum; 56 per cent at less than \$1,000 per annum. So a very large per cent of our population, through a lack of knowing how to do anything with their hands, have to take a very much decreased compensation.

New England is being educated by 11,000 women teachers, who can not and never should be held responsible for the technical education of her industrial population. Ten per cent of them abandon the profession every year for matrimony, and show their good sense in so doing. They do well and faithfully the work they are selected to do. What is true of New England is true of other sections of the United States.

The pressing lesson for America to learn is that continental Europe is paying more attention to her technical schools than she is to her standing armies. The manufacturers, especially in Germany, need no urging to support technical education. As the director of the Philadelphia Textile School expresses it, "American manufacturers are in a state of commercial savagery." Germany feels that the world's industrial supremacy is within her grasp. She applies technical education to every pursuit, and unless we follow her example I do not think we can supplant her as a commercial world power.

Probably the most striking argument in favor of technical education is shown in the British statistics from 1880 to 1890, showing the enormous decrease in

crime, juvenile delinquents, and pauperism resulting from the application of technical education.

The native New Englander is becoming more and more a wealth distributor and less and less a wealth creator, because of a lack of technical education. The thrifty foreigner is supplanting the native population because he can produce and create something, while the native New Englander is simply a distributor.

Germany does not rely upon any abstract theory of either protection or free trade, but educates her citizens to a definite concrete purpose—commercial supremacy. The German hands his liberty over to his Government, calls it his fatherland, and receives the best education the world produces to-day.

New England is already the producer of industrial ruins. Her textile supremacy has departed and her native population is dying out.

In closing this brief statement here I want to say this in answer to some very practical ideas I got in the way of objections from your committee as to what Congress can do. I have thought of several ways that will act as a stimulant to the adoption of a standard of education that will produce national men, men that can be used by the nation; for instance, in the consular service; and a new idea came to me to-day: The nation should contribute a bonus that will stimulate the States and give power to the National Educational Association to in some way enforce its system of education. It is a most admirable system of machinery, but it has no way to enforce its suggestions.

I was, some time ago, at the public-school commencement at Pawtucket, and listened to the valedictorian giving the imaginary career of that class. She was a scholarly, bright, New England young woman, but she did not put one of that class into a sphere of life where they could produce a cent. They would be real-estate men, editors, doctors, lawyers—some profession, creating nothing; yet of that state the average citizen is the richest person that walks the earth.

Q. Did you ever think of the obligation the Government owes to the colored people—to provide manual training schools, and thus help those States that are impoverished? Is it not the obligation of the General Government to help those States that are doing that work?—A. It is. In Kansas they have excellent manual training schools for the negro—some of the finest that I have ever seen.

Q. Booker Washington is on the right line with reference to the schools of the colored people?—A. Yes. You can use a man's hands to educate his brain just as effectively as you can the eye and the ear.

LOWELL, MASS., July 21, 1899.

TESTIMONY OF MR. JAMES T. SMITH,

Member of Board of Trustees, Lowell Textile School.

At a meeting of the Subcommittee on Manufactures and General Business, held in Lowell, Mass., in the city hall, July 21, 1899, Chairman Smyth presiding, Mr. James T. Smith appeared at 10 a. m., and, being duly sworn, testified concerning textile education as follows:

MR. CHAIRMAN AND GENTLEMEN OF THE COMMISSION: The manual-training school is intended to be part of the public-school course, while the textile school has in view the application of science and art to the textile industry. A man goes to the textile school to learn the textile business; he goes to the manual-training school to have his mind quickened and may be helped in the line of mechanics. It is expected the manual-training schools will eventually grow into trade schools; some authorities favor that, while others insist that the idea of learning a trade shall be kept entirely out of such schools.

The textile school differs from the university in that science and art are taught with a view of commercial and industrial application, and not for the purpose of educating professional scientific men. That idea is kept in view.

We have at the Lowell Textile School three, commonly speaking, science departments—decorative art, general chemistry, and mechanics. The other departments are simply for the application of those sciences, and with a good deal of physics. The decorative art department is for instruction in the fundamentals of all specialties of decorative art, the fundamental principles of historic ornament, the conventionalizing of plant forms, color, etc. After the student has taken that course he specializes, and in our school he takes up textile designing; but the same course of fundamental instruction is necessary for book illustration, lithography, ornamental ironwork, or any other purely decorative branch of art.

The chemistry department is as thorough in general chemistry as that of any leading institution in the country. We have a fine equipment, and give a two years' course in general chemistry. One can not be too good a chemist. It is not difficult to understand what an immense value to the industries of Germany the invention of the Hermsdorff black has been. We have developed as good a black at Lowell, but the value of the Hermsdorff dye not only depends on the chemicals, but on the methods of manipulation. In shaping hosiery we use a frame on which it is blocked. In the Hermsdorff method that block is of copper, hollow, with many minute holes, and after the hosiery has been dyed, the brilliancy and peculiar feel of the hose is given by the forcing of a little oil through the interstices into the fabric by steam. It is a very nice process. It gives a brilliancy to the fiber, one of the principal reasons why the Hermsdorff dye became so celebrated.

The third scientific department is the elements of mechanics, which we are developing. Three-fourths of the textile business is mechanics, and it is very essential for a textile school that it should be thoroughly gone into, and we have gentlemen who are thoroughly educated in mechanics who are rapidly developing that department. The other departments are the manufacture of cotton, woolen, and worsted yarns, and weaving.

The school sprang from this condition of things: Lowell was the first city where the power loom was set up.

Q. (By Mr. SMYTH.) What year was that?—A. In 1822 or 1823. They came looking for power and found it in the Pawtucket Falls, on the Merrimac, and there established themselves. Textiles include nine-tenths of the industries of Lowell, mainly cotton, but we have grown until we are in all fibers almost. We have cotton, worsted, jute, ramie, silk, and linen flax. Spinning develops more rapidly in some other parts of the State. We are in elastic goods, mohairs, and carpets. One of the leading carpet concerns of the United States is here. We are in elastic goods, suspenders, and webbing. Lowell is perhaps more broadly a textile city than any other city in the United States, using the term in its true meaning—weaving. There were early established in Lowell certain standards of plain goods, and the character of the goods has been so maintained that they have a large eastern market in China and elsewhere, and the trade-mark has become very valuable. As the South has developed capacity to manufacture cheaply, our mills have a tendency to go South and manufacture this class of goods there. This is practically an extension of the Lowell mills.

The development of the industry here has been to higher and finer lines. This has been hastened by the development of textile manufacture in the South in the coarser lines. We had to have higher skilled labor, not only in weaving and spinning, but in mechanics. And hence the textile school.

We found abroad very complete systems of textile education. You understand how thoroughly Germany and England and others have developed the system. We found, perhaps, the most satisfactory facts and conclusions in the report of John C. Monaghan, United States consul at Chemnitz, Saxony, published in the consular reports for August, 1894—an article entitled "Technical and trade schools." This is a labor of love with him, and he is constantly reporting to Mr. Emory's bureau. He is one of the most valuable men we have abroad. There is hardly a copy of the consular reports without something from his pen. Mr. Mason, of Berlin, and quite a number of our other consuls have turned their attention to this matter recently, and Mr. Emory's bureau has been of great value to us.

The details as to our textile school Mr. Crosby, our principal, can give you. The school is now in rented quarters, but we have looked up a lot for permanent buildings. The foundation has been laid for a textile university. Ours is the pioneer school and the only one on this continent devoted solely to textile education, though another will open this fall in cotton at New Bedford, while the Philadelphia Industrial Art Institute has a department for textile education that is very successful, and something is being attempted in the South. The character of the industries of Lowell demands it. We could not limit ourselves to any specialty.

It is important that such a school as this should be near the mills. I do not know of any foreign school that has succeeded unless it was in the vicinity of the mills, and it is the custom to so locate them.

Our Lowell corporations are practically Boston corporations, Boston financed. Only about one-fifth of the stock is owned in Lowell.

Q. What is the capital?—A. About \$20,000,000, the actual capital stock, and steadily increasing. In case of the most of our mills the stock has been very much scattered, and has been passed by descent, and now there are a great many families who are holders of stock. The statistics show that there are something over one-third as many stockholders as there are employees in the mills, the average holding being about \$3,000 per person. There are no bloated bondholders in our

crime, juvenile delinquents, and pauperism resulting from the application of technical education.

The native New Englander is becoming more and more a wealth distributor and less and less a wealth creator, because of a lack of technical education. The thrifty foreigner is supplanting the native population because he can produce and create something, while the native New Englander is simply a distributor.

Germany does not rely upon any abstract theory of either protection or free trade, but educates her citizens to a definite concrete purpose—commercial supremacy. The German hands his liberty over to his Government, calls it his fatherland, and receives the best education the world produces to-day.

New England is already the producer of industrial ruins. Her textile supremacy has departed and her native population is dying out.

In closing this brief statement here I want to say this in answer to some very practical ideas I got in the way of objections from your committee as to what Congress can do. I have thought of several ways that will act as a stimulant to the adoption of a standard of education that will produce national men, men that can be used by the nation; for instance, in the consular service; and a new idea came to me to-day: The nation should contribute a bonus that will stimulate the States and give power to the National Educational Association to in some way enforce its system of education. It is a most admirable system of machinery, but it has no way to enforce its suggestions.

I was, some time ago, at the public-school commencement at Pawtucket, and listened to the valedictorian giving the imaginary career of that class. She was a scholarly, bright, New England young woman, but she did not put one of that class into a sphere of life where they could produce a cent. They would be real-estate men, editors, doctors, lawyers—some profession, creating nothing; yet of that state the average citizen is the richest person that walks the earth.

Q. Did you ever think of the obligation the Government owes to the colored people—to provide manual training schools, and thus help those States that are impoverished? Is it not the obligation of the General Government to help those States that are doing that work?—A. It is. In Kansas they have excellent manual training schools for the negro—some of the finest that I have ever seen.

Q. Booker Washington is on the right line with reference to the schools of the colored people?—A. Yes. You can use a man's hands to educate his brain just as effectively as you can the eye and the ear.

LOWELL, MASS., July 21, 1899.

TESTIMONY OF MR. JAMES T. SMITH,

Member of Board of Trustees, Lowell Textile School.

At a meeting of the Subcommittee on Manufactures and General Business, held in Lowell, Mass., in the city hall, July 21, 1899, Chairman Smyth presiding, Mr. James T. Smith appeared at 10 a. m., and, being duly sworn, testified concerning textile education as follows:

MR. CHAIRMAN AND GENTLEMEN OF THE COMMISSION: The manual-training school is intended to be part of the public-school course, while the textile school has in view the application of science and art to the textile industry. A man goes to the textile school to learn the textile business; he goes to the manual-training school to have his mind quickened and may be helped in the line of mechanics. It is expected the manual-training schools will eventually grow into trade schools; some authorities favor that, while others insist that the idea of learning a trade shall be kept entirely out of such schools.

The textile school differs from the university in that science and art are taught with a view of commercial and industrial application, and not for the purpose of educating professional scientific men. That idea is kept in view.

We have at the Lowell Textile School three, commonly speaking, science departments—decorative art, general chemistry, and mechanics. The other departments are simply for the application of those sciences, and with a good deal of physics. The decorative art department is for instruction in the fundamentals of all specialties of decorative art, the fundamental principles of historic ornament, the conventionalizing of plant forms, color, etc. After the student has taken that course he specializes, and in our school he takes up textile designing; but the same course of fundamental instruction is necessary for book illustration, lithography, ornamental ironwork, or any other purely decorative branch of art.

etc. Our board of trustees is made up from citizens of Lowell, Boston and Lawrence. Lawrence is only 10 miles away. The great mills are represented in our board of trustees by the representative men of the mills, such as treasurers, agents, etc., and the heads of technical departments—like printing and dyeing.

Q. You have had no graduates yet?—A. We graduated a class this year, a 24-year class.

Q. Was their experience at school such as to be of much advantage to them in getting positions?—A. The time is so short; they have barely received their diplomas. We have found it almost impossible to hold a class to graduate, because the demand is so constant for advanced students, not only from the mills, but from the managing houses in Boston. They, especially, have been drawing on the classes.

Q. For what purpose?—A. In their designing departments; and they speak in very high terms of the results.

Q. (By Mr. FARQUHAR.) You speak of the stock of these mills here as being scattered and only one-fifth being held in Lowell; of that one-fifth what proportion do you suppose is held by operatives?—A. I do not think there is much held by the present operatives. There was a time when the operative seemed to be more thrifty and saved up a little money; he considered a corporation in Lowell was as solid as a rock, and when he got his money in such corporation stock it was as safe as he could get it; a great many of these old people have a share or two of stock.

Q. Are there any extra inducements held out by the owners of mills to induce these parties to buy stock?—A. The State of Massachusetts allows a corporation to increase its stock one-third if it will put it in small shares, but I do not think any corporation in Lowell has availed itself of that law.

Q. You have no system of cooperation in the mills?—A. None at all. Almost every race is represented here, and our attempt has been to find men who would work cheap enough to keep up the line of goods in competition with the sections of the country where they work and live cheaper. We have gone about as far as we can. I was in an evening school where there were 60 youths from Sparta. Our evening schools run after everybody else has gone to bed. We have a very extensive and thorough evening school system, and it deals mainly with these people who have no knowledge of our language.

Q. Have you many French Canadians?—A. Large numbers of the French Canadians and English. There has been a large immigration of Swedes, and lately a good many Greeks and Jews, Poles, and Portuguese are coming. We have a great diversity of nationalities.

Q. (By Mr. SMYTH.) There has been a great change in the character of the employee in the last 40 years?—A. Yes.

Q. Do you think the statement is about correct in that report made by one of the officials here in Lowell that in his employ only about 15 per cent were English or American born operatives?—A. I should not be surprised.

Q. And 5 per cent of Greeks and over 43 per cent of French Canadians?—A. Yes. A certain per cent of the French Canadians are transient; they come here and work a season and go back and work on the farms, but the French section is growing rapidly. Every race is bettering its condition, and it does not accord with the statement of Henry George that the rich are growing richer and the poor poorer. The Irish are filling the best positions, and the French Canadians are improving very rapidly, from the indications in their section of the city. Every race that has come to Lowell has bettered its conditions.

Q. You speak of the French Canadian quarters, etc.; do these live in certain quarters of the city; do they lack assimilation?—A. At first. They do not, as a rule, speak English when they come and there is a certain colonization here that keeps them together; but they show a constantly growing independent disposition to assimilate.

Q. Do they seek to have churches and schools in their native language?—A. The French have maintained schools in their own language. The church is the center, and they have parochial schools. It is the desire of the church to keep these people together. I think there is a growing independence among the French, and a general desire to become thoroughly assimilated. The race is not prejudiced, and they assimilate wherever they go.

Q. (By Mr. FARQUHAR.) Is French the language taught in the parochial schools?—A. They teach English also; that is a requirement of the State law. There has been some controversy over that. The State law requires that there shall be a thorough English education.

Q. (By Mr. SMYTH.) Are they supported in part by the State?—A. No; but the law requires that a scholar shall have an English education and places the parochial school under the inspection of the authorities.

Q. (By Mr. FARQUHAR.) The State law controls the care of the child and its education, whether in the parochial or general school?—A. The State claims full power to enforce a thorough English education for every child in the State.

Q. Have you compulsory education here?—A. Yes; it is a requirement for working in the mills that they shall have attended school. We spend over one-third of our city revenue on the public schools, and a great part of it goes to the people who work in the mills.

Q. (By Mr. SMYTH.) How about the Greek colony; do they live together largely?—A. Yes; the Greeks have taken the section formerly occupied by the Irish and driven them out.

Q. Do the Greeks have their own churches and schools?—A. Yes. The older immigrants are scattering and becoming assimilated.

Q. (By Mr. FARQUHAR.) Is there any change in the character of the present operative, from the old American and Irish kind, as to social life, condition of living generally, law and order, and such matters as that; is there any improvement?—A. The French are a very thrifty people as a class; the Norwegians and Swedes are especially so—the most thrifty class that comes here, perhaps. The farther north you get a race, the more thrifty. You will find the lowest paid operatives in the State are in the textile cities and the textile industries. Necessarily it takes a class of people as operatives who would not be in demand in other industries requiring higher education and better opportunities, and so far as that is concerned, we do not rank up with some cities. So far as morals are concerned, I think we rank fairly with other cities of the State. Our largest shift of policemen on duty is only 25, in a population of 90,000, made up of a half dozen different races. That indicates a well-behaved city.

Q. By improvements in appliances can the textile mills utilize operatives of less intelligence?—A. In some processes, yes; in the higher, no. We live far from the source of the raw material. We want to use more brain and skill, and reduce the raw material to the minimum. That is the tendency of late—to develop education in mechanics in textiles and in a variety of ways to increase the skill and intelligence of our people.

Q. The aim of your education is to fit either for selling or manufacturing?—A. Yes.

Q. Which of the two do you seek to develop most?—A. Our main object is to develop the manufacturing. We have been endeavoring to get Boston interested, as Philadelphia has become interested, in commercial education. It is necessary to find a market to avoid overproduction. We have but touched the hem of the garment of textile manufacture. A short time ago we were importing \$100,000,000 more in textiles than we were manufacturing; we had to import \$100,000,000 to supply the local demand. We have reduced that yearly, but we have not got our own market yet, and here is half of the world which has just taken up the fashion of wearing clothes! There never was so fine an opportunity for starting some system of commercial education to sell goods in the foreign markets. The National Government has been very liberal to the movement in Philadelphia, and we have been endeavoring to get Boston to see that and develop something here. In fact, I expect a gentleman here who is organizing a school in Boston for that purpose, who will bring it before the Boston merchants. It is very important; and that is a direction in which the United States Government can legitimately help, encouraging commercial education. If you can make your commission permanent, and into a department of commerce and industry, supplemented by a State bureau, keeping in touch with the voluntary commercial organizations so the hand of the Government will be on the business pulse all the time, you will do a great work toward developing the industries of the country.

Q. (By Mr. SMYTH.) Are you running full time?—A. Everything is running up to its limit.

Q. Any dissatisfaction among the employers or employees?—A. None to-day; they would be here if there was. Our textile machine shops are running full blast, but they can not handle the business.

Q. Conditions different from what they were two years ago?—A. Different from what they were two months ago.

Q. (By Mr. FARQUHAR.) The improvement in the foreign market is responsible for that?—A. It is a natural recovery from extended depression, and new countries being opened up; we have come to another business revival. We will probably have another business panic in the future some time. It is well to anticipate these things. There should be some systematic gathering of facts at Washington, keeping in touch with the country on the Weather Bureau idea.

Q. Is your proposition somewhat on the line of the Agricultural Department

there with respect to agricultural education through the States?—A. I have not followed that very closely. I presume it is something like the German system.

Q. Experiment stations, etc.?—A. We have that system in Massachusetts. The German supplements that by the traveling lecturer, who goes from house to house and farm to farm. But they have that system running through all lines of education, and are gathering the facts from all over the world and improving on them if they can. Of course the textile business is locally confined to certain sections of the country. People will not go into textiles who have opportunity for other lines of activity. We are simply developing in Lowell, going into higher and finer lines. There is not anything made abroad which we can not make here when we learn how. The school is to do that.

Q. You qualify that by the words "as soon as you know how;" then you have not all the facilities now to meet the import trade?—A. We have people here and there that know how, but we have not the body of skilled labor, and it is the object of the textile school to teach it. We are continually introducing new lines. The great textile machine companies in Lowell are to-day making English machinery equal to anything that has been imported. Even up to a year and a half ago we would have to send to England for machinery we can duplicate now from the Lowell machine shop from drawings made by boys who had an education in the schools of the State and then a year at the textile school, machinery which will duplicate any made in Europe and also better.

Q. (By Mr. SMYTH.) In the last 20 years there has been a great stride forward in goods formerly imported altogether?—A. We are constantly increasing the variety and raising the grade of the goods. The development in Bristol County has been along the line of yarns mainly, but they have supplemented that by fine goods.

Q. Are there goods made in New Bedford made nowhere else in the United States?—A. I do not know. I do not know of anything, except threads and some trimmings, made in the United States, that is not made in Lowell; there may be lines. I was called upon some time ago for a statement of the varieties of textiles made in Lowell. I wrote to one firm and found it would take two weeks to make the list. We have all the pile goods, velvets, carpets, everything of that kind; and there is no end to the variety of our dress goods, as you will see on the market here to-day.

Q. (By Mr. CLARKE.) Where do your students in the school come from, mostly?—A. I think about three-fourths from Massachusetts, four-fifths from New England, and the rest scattered over the country. There are some from the South. The catalogue gives the residences of all the day students.

Q. Are most of the evening students residents of Lowell?—A. About four-fifths of them. The others, the most of them, come from Lawrence and Methuen, and there are a few from the villages around Lowell where there are mills.

Q. Do those who come from the other cities pay tuition?—A. Yes; they will continue to pay, but it is merely nominal, about \$5.

Q. I understand you to say the city maintains an evening school for general instruction not connected with your textile school?—A. Yes, many, at an expense of some \$35,000 a year.

Q. That is attended largely by the new residents and the children of the operatives, I suppose?—A. I judge so; that is the understanding. It is almost as thorough in its essential departments as the day school. It stands very high.

Q. Do you find that the children of foreign-born parents, or children who have been born abroad, work readily into your textile school?—A. Now, that is a matter for the instructors; they can tell you better than I. My work is corporation board, more than that of the school proper. The school is managed under a board of trustees, and Mr. Crosby, our principal, can tell you more about it. The names given are an index, to some extent, to their nationality. I think the English is the element that most readily appreciates the schools, and send their children more than any foreign element. They know what the school will do for a man. There are some few Swedes, but I notice that the English are more staunch friends of the school, and fully appreciate the benefits of it.

Q. Do you find these foreign-born elements develop skill rapidly in the mills?—A. You will have to ask the manufacturer that. I have opinions and views, but you want facts, and the manufacturer is the only one who can tell you that. I had an idea the French would be very valuable. They have a latent artistic nature, and as we advance in designing we find them a very valuable element; but I have no experience in that, and the mill men can tell you better than I can.

Q. Are most of the goods produced in Lowell sold through commission houses?—A. Most of these old corporations are conservative, solid, substantial, non-speculative corporations, with no water; they are never in the stock market. We have

an old system of selling through selling agents; here and there one sells on commission. The transactions are very large in most of the classes of goods, and a good share of the goods go out of the country. We are getting more and more to taking orders for the New York market.

Q. You speak of the change from the lower and coarser grade of goods to the higher and finer. What market do these higher and finer goods obtain mostly?—A. Domestic, very largely. They are made in small lots and greater variety. It has made a demand for scientific skill at the head of the mill management, especially in designing and mechanics.

LOWELL, MASS., July 21, 1899.

TESTIMONY OF PROF. WILLIAM W. CROSBY,

Principal of Lowell Textile School.

At a meeting of the Subcommittee on Manufactures and General Business, held in the city hall, Lowell, Mass., on July 21, 1899, Chairman Smyth presiding, Prof. William W. Crosby appeared at 11 a. m., and being duly sworn, testified upon the subject of textile schools as follows:

Q. (By Mr. SMYTH.) What is your name?—A. William W. Crosby.

Q. You live in Lowell?—A. At Woburn, Mass., a few miles distant.

Q. What is your business?—A. Principal of the Lowell Textile School.

Q. Can you tell us something of the working of that school?—A. In the day school we have 4 regular courses and the night school embraces 5 regular courses. The day courses are cotton manufacturing, wool manufacturing—each of these courses has enough of whatever is in the textile business to make it complete. So when a man has taken one of the courses he will have instruction in everything that touches his business. There is a difference between cotton spinning and cotton manufacturing, the latter including the former; similarly with wool manufacturing and woolen or worsted spinning. The third course is designing, and the fourth is chemistry. The first course in the night school is cotton spinning, which includes yarn making; second, woolen or worsted spinning, converting wool into yarn; the third course is the designing; the fourth is chemistry and dyeing, and the fifth is weaving. The night course embraces 2 evenings in the week, taking 3 years to complete the whole course. That does not mean we will accept nobody who comes in for a part of the term or year, but if he stays the 3 years and completes the work he is awarded a certificate, or diploma. No one who has attempted that and has attended all the sessions, or most of them, has failed to obtain that certificate, or diploma. No one has been turned down on account of the severity of the course, and no one has been found who, if not called out before graduation, with proper application was unable to compass it. If a man knows how to read and write English and can do ordinary problems in arithmetic he is entitled to enter and can complete the course without difficulty. It is found, however, if a man is going to become thoroughly familiar with machinery we can give it to him much better if he is familiar with algebra. There are certain elements which, if acquired, will put a man in a position to be a master of machinery much quicker than without them. These are the points we are looking for. I have told you the general extent of the course and will leave the technical details unless you have some special questions to ask me.

Q. (By Mr. FARQUHAR.) How long have you been with the school?—A. The school was going one term before I came. I was an instructor in the school during the first full year.

Q. From what school did you come here?—A. Massachusetts Institute of Technology, Boston.

Q. You were never connected with the New Bedford school?—A. No.

Q. How long have you been here?—A. Two years in this school.

Q. As principal?—A. One year as principal and one year as instructor.

Q. You have graduated a class this year?—A. Yes.

Q. From your own knowledge, were the boys who went out competent to take quite an advanced position either in the commercial or manufacturing line?—A. I should say so; yes.

Q. Do you think you turned out any graduate there that was fitted to manage a mill?—A. No; because he has not yet learned to manage men.

Q. Are you combining both the commercial and mechanical?—A. Yes; to a certain extent. We are studying how to do that now.

GENERAL AND INDUSTRIAL EDUCATION.

Q. You are not attempting too much specialization in your teaching?—A. We endeavor to reach that if we can. We watch the demand and our board of trustees is expected to tell us what is wanted.

Q. (By Mr. SMYTH.) You spoke of some of your young men being called away before graduation; into what departments of business or commercial life are they called; to fill what kind of places?—A. In one instance a young man went into the designing department and succeeded in solving a problem that had bothered other and more experienced men. Their work had been within certain grooves, but this young man had learned the elements of designing and solved the problem in short order. This particular pattern had been returned as not being able to be worked successfully, yet he went to work on it and solved it.

Q. Is your school limited to males?—A. No; we have had several young ladies studying decorative art and textile designing this year. They will take the 3-year course in designing.

Q. (By Mr. FARQUHAR.) Is it your experience that young ladies learn the designing as rapidly, or moreso, than men?—A. Equally as well, we think.

Q. Is it not a fact that now in the manufacturing line, especially in that class of art, the women in all of our great cities are equal to men?—A. Yes.

Q. And some of them are really farther advanced and getting higher salaries?—A. Yes; I know of cases of that sort. If it is a question of making a pattern and leaving it to others to harness in the loom, they are strong there. They have worked on the hand loom and have made some very fine goods.

Q. In your classes do you find the native American showing more adaptability than the foreign born?—A. Not necessarily. I have had some experience in teaching before I came here, and with young people from all over the world. I taught at the Massachusetts Institute of Technology before I came here; a Japanese in my class was fully as conversant in mechanical details as anyone. There seems to be no particular line to be drawn.

Q. Have you any colored pupils in your school here?—A. No.

LOWELL, MASS., July 21, 1899.

TESTIMONY OF MR. CHRISTOPHER PARKINSON BROOKS,

Managing Director New Bedford Textile School.

At a meeting of the Subcommittee on Manufactures and General Business held in the city hall at Lowell, Mass., on July 21, 1899, Chairman Smyth presiding, Mr. Christopher Parkinson Brooks appeared at 12 m., and, being duly sworn, testified concerning textile schools as follows:

Q. (By Mr. SMYTH.) What is your name?—A. Christopher Parkinson Brooks.

Q. Residence?—A. New Bedford.

Q. What is your occupation?—A. Managing director of the New Bedford Textile School.

Q. Can you tell us something of the New Bedford Textile School, when founded, present condition, etc.?—A. The New Bedford Textile School is one of six in existence or being erected in this country. The Philadelphia school is the oldest, having been established 15 years ago, and probably the best equipped. The Lowell school follows next, established 2 or 3 years ago. The New Bedford school is established under the same act, which provides for an appropriation of \$25,000 on condition of the city appropriating \$25,000.

Q. Annually?—A. No; a foundation appropriation. The New Bedford trustees did not hasten the establishment of their school, but waited to see what the experience was in the other cities, and they have now decided that the better plan is to erect their own building and equip it with as great a variety of machinery as possible, rather than rent a floor or purchase an old building and change it over, as was done in Philadelphia. So there is now in course of completion in New Bedford a building 110 feet long by 60 feet wide and three stories high, on the main business street, which will be equipped, and has almost been equipped, with a complete equipment of cotton machinery, from the picker to the cloth room. This machinery is not only of every variety found in the mill, but is from almost every machine builder in the United States, so as to give the students an opportunity to judge of the different methods and the merits of different machines.

The general features of the school, curriculum, etc., are not very much different from the Lowell school, of which I was the first director, and the organization of

which I, to a large extent, planned and was responsible for. There are certain advantages and improvements the trustees have seen fit to make in New Bedford, but you will see in Lowell to a large extent what is at New Bedford.

Q. One is very much a duplicate of the other?—A. Except in New Bedford we are making a special attempt to make it a cotton school. In this we are following the German plan. I am very familiar with the foreign textile schools. I have made several visits to the Continent and am familiar with England, and I have found the German system the best that can be followed. It is the oldest. They have had schools for 50 years, and their textile schools are now ahead of any other schools in quality and excellence, though England outnumbers them in number of schools and number of students. For instance, in the textile schools of England Sir Philip Magnus told me they had 26,000 students in different parts of Great Britain, in between 300 and 400 cities, towns, and villages, of which number 3,000 to 3,500 were studying textiles. In this country we had last year probably not over 400 scholars in the whole country studying textiles. The textile school movement is being developed in the South, and a school will be established this fall in Atlanta, Ga., which forms part of the system of the Georgia School of Technology. A special appropriation has been made by the Georgia legislature and also by private individuals which will enable them to open a good school there. A similar school has been attached to the Clemson College in South Carolina, and the Fall River authorities have now taken advantage of the act of the Massachusetts legislature by appropriating \$25,000, making with the State appropriation a fund of \$50,000, and have taken steps to establish a school within the last few weeks.

Q. (By Mr. CLARKE.) Will that be devoted to cotton only?—A. Largely to cotton, I imagine.

Q. (By Mr. SMYTH.) You think it is important to have these schools located close to mills.—A. Undoubtedly. I certainly think they should be located adjacent to mills and specialized to suit local industries. German schools are under the control of the minister of trade and commerce, and one of his departments regulates the curriculum, and will not allow a silk school to be established in a cotton locality, or a cotton school in a silk locality. They have in Crefeld one of the finest textile schools in the world, almost entirely devoted to weaving silk. They have, 14 miles away, at München-Gladbach, a cotton school; 30 miles away, at Mulheim, what they call a half-cotton school, mixed goods, and at Limbach they have a hosiery school; and so on throughout the country.

There is no doubt at all in my mind that textile schools and trade schools ought to be encouraged. On the different visits I have made to Europe I have found each time that the trade schools have been increasing, and manufacturers have shown a greater appreciation of them; in cities like Crefeld the schools have had an influence in bringing trade to the cities; and in England and Germany it is getting to be the custom for a young man to go to a textile school to get his education. He gets in 2 or 3 years the best training in manufacturing, and what is of more value than all, he gets trained systematically, whereas if he goes into a mill there is no one to direct him, and he wanders aimlessly from one department to another for 4 or 5 years perhaps, wasting time, and he only gets experience in one mill, whereas in the school he gets the concrete experience of the whole of the industry, so far as the instructors can give it to him. The German appreciates the textile schools very much.

Q. Do they allow foreigners to enter?—A. In almost every continental school they charge double or treble the fees for foreigners. There are many American students over there in every school of importance.

Q. Are there any secrets of trade they are not willing to give to other countries?—A. As a rule, they are willing to teach everything they know.

Q. (By Mr. FARQUHAR.) In chemistry or coloring?—A. At this school in Crefeld I found in 1897 they had built an addition equal in size to the original, for the purpose of taking up chemistry, bleaching, dyeing, etc.; taking goods from the local manufacturers, bleaching, dyeing, and finishing them; and the students have every opportunity to get a knowledge of the processes, regardless of nationality; but they are beginning to prohibit taking foreigners. In the Charlottenburg school a rule was made last spring prohibiting any foreign students entering. The British Government in 1884 found these German schools making so much progress and increasing the manufacturing in Germany to such an extent, that a royal commission was appointed, with powers resembling your own, but somewhat limited, with special instructions to report especially on German and other industries, and the result was that an appropriation of \$3,750,000 was made by Parliament annually for the purpose of technical education, which includes trade education of all kinds. That was raised by a tax of 12 cents a barrel on all the

beer brewed in the United Kingdom. The result is there are now over a hundred schools teaching textiles to a greater or less extent, whereas in 1884 there were not probably over 4 or 5. England is to-day practically supplying the demand in this country for expert trained workmen. If you advertise for men to take a position in a mill, you will find perhaps 25 per cent will say they graduated from a textile school in England. We ought to train our own men, and not rely on imported labor.

Q. (By Mr. SMYTH.) Would you advocate a tax of 12 cents a barrel on beer in the United States?—A. If we can establish the schools in no other way.

Q. (By Mr. CLARKE.) How was the money raised in Germany?—A. Almost entirely by a combination between the national Government, the local government, city, and manufacturers. As a rule the national Government appropriates about one-third, the local manufacturers contribute about one-third, and the city about one-third of the cost of establishing. That varies in different places. There is one school there that is supported entirely by the manufacturers. There is another school that was established in the beginning by the trade unions, but that has been taken over by the authorities. The Massachusetts system is modeled after the German system.

Q. (By Mr. SMYTH.) Have you the same mixed population in New Bedford that you have in Lowell?—A. Yes, but we have a large per cent of Portuguese, and they make very fine citizens.

Q. The percentage of native-born Americans is small?—A. Yes; and generally found in the higher positions. Of course New Bedford makes very fine goods—probably the finest goods in this country. If a mill is engaged on fine goods, it requires more highly trained men to manufacture these goods, and you will find there a larger proportion of native-born Americans. There is a large proportion of English, some French-Canadians, but probably the English and Portuguese form the bulk of the foreign-born population.

Q. What percentage of the workers in the mills are Portuguese?—A. Speaking from memory, perhaps 25 or 30 per cent.

Q. Do they live in certain parts of the city to themselves?—A. Yes.

Q. Have their own churches and schools in their own language?—A. They have churches of their own, but they attend the public schools. They are very thrifty; they come here not knowing how to speak a word of English, and in a few years have saved money and bought a little farm. "Textile education" is a very narrow term, and it ought to be called "trade education." There ought to be schools for imparting education in plumbing, electricity, and everything else, just the same as textiles. It would be a very important and valuable thing if this commission would indorse the establishment of trade schools throughout the country.

Q. You think "trade schools" would be a better term than "technical"?—A. Yes. The latter should be applied only to institutions like Cornell University, Massachusetts School of Technology, Lehigh University, where they train professional men. The trade school forms a distinctly different class, in which a man can go for 1, 2, or 3 years and learn the technique of his business. It is very important in this country, where it is customary to attend school a much longer time than in Europe, and where a man assumes responsible duties much earlier and has a much more limited time in which to learn his business. Trade schools would enable him to learn his business quickly and at the same time thoroughly.

WASHINGTON, D. C., January 4, 1900.

TESTIMONY OF MR. H. B. FRISSELL.

Principal, Hampton Normal and Agricultural Institute, Hampton, Va.

The commission met at 11.10 a. m., Vice-Chairman Phillips presiding. At that time Mr. H. B. Frissell, of Hampton, Va., principal of the Hampton Normal and Agricultural Institute, was introduced as a witness and, being duly sworn, testified as follows, concerning industrial education of the Indians and the colored people:

Q. (By Mr. A. L. HARRIS.) You may state your name, place of residence, and occupation?—A. H. B. Frissell, Hampton, Va.; I am principal of the Hampton Institute.

Q. How long have you been principal of the Hampton Institute?—A. Since 1898.

Q. Were you connected with that institute previous to becoming principal?—A. Yes; I have been connected with it since the year 1880.

Q. From what part of the country did you go to Hampton Institute?—A. From New York City.

Q. You have traveled somewhat in the South?—A. Yes; quite considerably.

Q. You have observed the conditions of the agricultural industry in the South?—A. Yes; I am quite interested in that.

Q. What was your profession before going South?—A. I was a teacher. My only occupation was that of a teacher. I went through a theological seminary in New York and was ordained a clergyman. I went directly into the work of teaching in the South, and was first chaplain at the school there at Hampton, then became the vice-principal, and then the principal.

Q. Were you brought up on a farm?—A. Well, my father was a clergyman, but he did some farming. I was born on a farm in Dutchess County, N. Y., so I was familiar with farming conditions as a boy.

Q. (By Mr. PHILLIPS.) What were the circumstances under which you went South?—A. My father was always interested in the negroes, and my health was somewhat poor, so that I thought that a change of climate would be good; I went with the idea of remaining temporarily and became interested, and so have staid there for 20 years.

Q. Please state the manner in which the institute was organized and its object, and from what source you receive your support?—A. The school was started originally by a missionary organization—what was known as the American Missionary Association. It was started soon after the war, as so many of the other negro schools were, and General Armstrong, who was with the colored troops, took charge of it under this association. Then, as the school grew, General Armstrong felt that it ought to have a life of its own, and asked to have a board of trustees appointed and have it taken out from under the care of this association; and so a board of 17 trustees was appointed, and the school was chartered by the State of Virginia as a normal and agricultural institute for training teachers for the public schools, first of the state and then of the South generally; it also gives instruction in the trades. It receives support under the land-scrip fund—a third of the interest of the land-scrip fund of the State of Virginia—and also a part of the Morrill Act money that is appropriated to agricultural colleges, and it receives also help from the Slater Fund. John F. Slater left a certain amount of money, running up into 1 or 2 millions, for the help of industrial education among the blacks of the South, and Hampton receives from that \$12,000 a year. It receives also \$2,200 from the Peabody Fund, and it has 120 Indians, receiving for each of these Indians \$167 that is annually appropriated by Congress. The cost of the school is now between \$140,000 and \$150,000 annually. We have an endowment fund of something over \$700,000, and about \$80,000 we have to raise from charitably disposed people, and from churches, Sunday schools, and so on, through the North.

Q. What number have you in attendance?—A. We have already, of day students and boarders, about 1,000; about 650 boarders and the rest day scholars; and of these between 120 and 130 are Indians.

Q. The others are colored?—A. The others are colored.

Q. (By Mr. CLARKE.) Are they male and female?—A. Male and female.

Q. (By Mr. FARQUHAR.) What is about the average age?—A. In the boarding department the average age is about 18. Inasmuch as we have industries there, shops and so on, we do not mean to take students until they are able to enter the industrial training schools, and that requires that they should not be very much below 16 years of age.

Q. (By Mr. A. L. HARRIS.) Into how many divisions or classes are you organized?—A. We have what is called the academic department of the school, in which we mean to give sufficient knowledge of English, mathematics, and so on to enable our students to pursue properly their course in the trades and agricultural and domestic science departments. We have the academic department, the department of agriculture, the department of trades, and the department of domestic science; and besides that we have what we call our normal school, which is devoted especially to the furnishing of teachers for the public schools of the South.

Q. (By Mr. PHILLIPS.) Are the Indians instructed in different buildings?—A. No; they have separate quarters, and separate tables in the dining room, but they are instructed in the same class rooms and the same shops with the blacks.

Q. Do you find any antagonism between the Indians and the negroes?—A. No; we have found that they work together very well. We have thought that it was a very great help, especially to the Indians, and yet I think it is of value to both

racers to have them put together there. As I have tried to show lately in increasing our appropriation for the present year, I think it is the only experiment in Indian education which has been successful in connection with that of another race. Almost every experiment in Indian education, where they have been put alongside of whites, has failed; but our records, as shown by the reports made to Congress and the investigation made by the Indian department, show that it has been a greater success than any other school, and I think that is because the two races are very close together in a good many respects; and they have been placed together side by side, and have been actually helpful to one another.

Q. (By Mr. A. L. HARRIS.) After leaving your school, after receiving the training they receive in your school, how successful have they been in performing the work for which they have been educated?—A. You refer now to what class, to the Indians?

Q. To either: I do not want to limit the question.—A. That is rather a hard question to answer. Of our graduates, about 90 per cent have gone into teaching, or at least have up to a very short time. I have in my pocket a short statement which will indicate what has been done. For instance, we have been making an investigation this last year, which shows that of our colored graduates living—and of course we have sent out from Hampton now about 1,000—of these 803 are living and 150 dead; 953, in other words, are accounted for. Of these 140 are in various occupations, 227 are teaching, 26 are teaching trades, 60 are teaching and operating farms. I would say almost all that have taught have also farmed more or less. There are 5 that are teaching farming and working at trades, there are 15 who are teaching and working at trades, there are 31 that are engaged in working at other occupations; that makes 504. Working at trades to-day, 47; in professions, 53; farmers alone, doing that alone, 15; students in other schools, 34; other occupations, 124; 26 unknown, and 150 have died. That about covers it, I think.

Q. (By Mr. PHILLIPS.) About what proportion of those are male and female that have gone out?—A. We have usually had about three-fifths males and two-fifths females.

Q. (By Mr. A. L. HARRIS.) Those that have taken up the profession of teaching, how successful are they?—A. We think they have been fairly successful. We think on the whole that they have made as good a record as any negroes in the South. Booker Washington, of course, is one of our graduates, and he has been a very great success. We have sent down to help him in his teaching and in his industrial work at Tuskegee between 40 and 50; and what has been done at Tuskegee has been done in a smaller way in almost every state in the South. We have had teachers of industries, and we have established schools that have been outgrowths of a smaller sort, like Tuskegee, in almost every state in the South.

Q. Are they generally under the control of the graduates of the Hampton Institute?—A. Yes; very largely.

Q. What is the number of the faculty?—A. We have altogether about 80 teachers and heads of departments and matrons, and so on, employed in various ways; those that have general direction. Of course there is a much larger number of employees than that, but I mean those that in a general way are directly engaged in the education.

Q. Do you have what is known as a manual-training school?—A. Yes, we have connected with our academic department a manual-training school. From the time that the children commence in the kindergarten until they graduate from the academic department they are having what we call manual training of some sort. We believe very strongly that labor, that the habit of work, is to be the solution of the race problem; and so we commence down at the Whittier school with our washtubs and our ironing boards.

Q. Please give a description, if you will, to the commission of your manual-training department, and the number of departments that you have.—A. Every boy and girl that comes to Hampton has to work from the time that they start—of course, all students do not go into this Whittier school, only our day scholars. We have in this day school 3 or 4 hundred, and they come from the community around us, but it is a regular part of our school work which is connected with the county; they give some help, but the teachers are under our appointment. We commence down in the kindergarten department, and there we teach the smallest children to work. For instance, on Monday they have their washtubs; on Tuesday they have their ironing boards. They learn to do small pieces of carpentry work, even to make parts of houses. They are at work at the simplest sort of things. We take them out on to a little piece of land in the springtime, and they have their rakes and their hoes, and they cultivate radishes and cultivate flowers. We try to commence from the beginning, creating in them a love for

work, and I think we have succeeded. Then, as they grow up and take up books somewhat, they take up at the same time working in wood and working in iron and work in clay; and the girls commence working in cooking and in sewing, and that goes along through our preparatory departments; the two go right along together, but the emphasis is laid every time on the industrial side, on the manual training, and the book side is subordinated to the work side, because to us it seems that the doing is the important thing and the knowledge ought to be harnessed in some way to the doing, and the knowing on the book side ought to be harnessed to the doing.

Q. (By Mr. CLARKE.) Is that the rule all through the course?—A. That is the rule all through the course. The majority of our students that come into our boarding department go into what is called our night school, where they work for a year—10 hours a day—in order to learn to do work, and to do it carefully. They are put into our various shops. We have 16 shops and a large sawmill, where they get a chance to work and very largely earn their board and clothes; and in that way they learn to work 10 hours a day, and they go to school 2 hours at night. While they are doing that, they get also an idea of thrift; they get some idea of laying up for the future. They are not allowed to spend this money; they must put it up for the years to come, when they have not so much productive capacity, and at the same time leave more chance for instruction—what we may call instruction. The first year is given up very largely with the most of them to this work. Of course if they come with money they can go right into the classes; but most of them that come into the boarding department spend a year, in order to lay up enough credit so that they can go into the regular classes. In that way they get ideas of thrift, and at the end of the year, when they have a balance to their credit, they are a different sort of boys and girls from what they were at the commencement of the year when they did not have any credit, or did not have it to a certain extent. When they first come into the school we do not put them into books; we take them to our laboratory. For instance, every boy and every girl is put into the chemical laboratory and into the physical laboratory, where they get the first principles of these things, so that they shall know something about air and water and soil, and all that sort of thing. Then they begin to write about these things, and they begin to talk about these things, and then gradually we introduce them to books; but we put the doing of the things first all the way through—all through the institution—and the result is, it seems to me, that there comes out of it a love for work; and I believe that has been demonstrated in the case of our graduates. Speaking of this labor that is given to them, they can get at the rate of about 8 cents an hour if they are fairly capable workmen; and we have a large sawmill where we employ a number. We also have different shops where they can get work, and our farms give them employment. These are what are called productive industries. Then, after they have passed through this year in which to lay up and prepare themselves in a certain way, they enter into regular school life in two or three ways. They can go into the academic department, and in that case they take certain studies in history and geography, and all the rest, but all related definitely to agriculture and trades; and they have manual training. There again, just as in the Whittier school, we commence with woodwork, and the girls have sloyd and our boys have what we call manual training—that is, they go from one process to another just as they would in arithmetic. It is a carefully arranged process by which they take up one thing and go through that to another and from that to a harder thing, so that each is a problem and each is a mental discipline. They pass up through that, and then they go into bent-iron work. They go from that into turning, and then from that into iron work and tin work, so that every boy, for instance, before he graduates has had work in wood and in iron and in tin, whether he is going to be a tradesman or not. Whether he is going into a trade or not he has to have that.

Every girl is taught something of woodwork and is not allowed to graduate unless she can cook a good meal and at the same time make her own dresses. She must make her own dresses for graduation and be able to make her underwear. Then there are some that do not go through the academic department at once. They want to go directly into the trades after they have been through their first year. Eventually I hope not to allow any boy or girl to go into a trade before he goes through the academic course. That is not true yet. But we allow them, after they have gone through the year and gotten some knowledge of English and some small knowledge of mathematics—we allow them to go directly into the trades. Now we have what we call the trade school, which has cost us about \$50,000, and there we teach blacksmithing, wheelwrighting, carpentry, painting, bricklaying, glass setting, together with work in shoemaking, carpentry, and harness making; and then we have mechanical drawing for all that go into the trades.

We have a 3-year course at present in trades work. The first year they have regular instruction. Here, too, they have a regular fixed course, going from the simple process of carpentry, for instance, to another and from that to another, and so on. The second year, as they have no money and they have very likely exhausted what they had the first year, we put them out to work in our shops. For instance, in our sawmill we are doing work for the community around us. We saw from 30 to 35 thousand feet of lumber per day when we are in actual operation, and what we saw, a good deal of it, we sell directly, and a good deal of it we make up into interiors of houses, and do all sorts of woodwork; and they get in connection with that large sawmill and wood-working establishment a definite knowledge of business. They learn how to estimate for houses, and they get the practical side of it. Then after they have been out in the shops for a year we send them back for the third year in their trades, into the trade school proper, where they have more of the theoretical side; so that before they graduate, before we give them their trade diploma, they have got some knowledge both of the practical and theoretical side. Of course you understand for these races there is not as much chance as there is for the white race, and we have to give them greater opportunities for the business side than in an ordinary school for the whites. The most of those that go through the trade school in that way finally complete our academic course and graduate from that. While they are doing this, after working in the trade school in the day, they go in the evening to some literary work. I think that completes the general statement.

Then, besides these, we have post-graduate courses, as it is said, in our academic department for those who are fitting themselves for teachers, and a certain number in our trade school who are fitting themselves to teach blacksmithing, carpentry, and also those who are fitting themselves to teach in our domestic science departments. I have not explained that, by the way. We have a domestic science department, where we are making teachers of cooking, teachers of sewing, and teachers of dressmaking.

And then some will go into the agricultural department after they graduate from the academic department of the school. We have two farms—one of about 100 acres in the school proper, with an experiment station, and another farm of 600 acres some distance out. Now, as I said, all our boys and girls receive instruction in agriculture. Before they go into this part of the regular academic department they are given instruction in the soil, in plant life, and in animal life. They go off onto the farms more or less to see what is going on; they have regular lectures on these subjects. And then there are a number that take up agriculture as a profession—that is, they will be teachers of agriculture. They are fitting themselves to instruct in agricultural schools. There is a continual demand for that sort of thing.

Then, as I said, we have this domestic science department, which comes in. All of them receive instruction in cooking and sewing, and there are a good many who are fitting themselves to be teachers of these things, and so they get special instructions along those lines. I think that gives a fair idea of what we are trying to do.

Q. (By Mr. FARQUHAR.) What are your means adopted for moral education in this school?—A. I think, on the moral side that the manual training and the trades and all that have a good deal to do with the moral training, looking at it from that point of view. We believe that since we got our manual-training department our boys are more honest than they were before; there is no question about that. And in addition, on what might be called the moral and religious side, we have daily services, with the reading of the Bible and prayer. The school is entirely undenominational; it receives its support from Protestants and from Catholics and from Jews; and we have always rather prided ourselves in our undenominational character. Some of the warmest commendations we have had have been from Hebrews and from Catholics, as well as from Protestants, and our thought has been to take these boys and girls from the communities from which they come and give them an unsectarian training—religious, strongly religious. Priests come to us and meet those who are Catholics. Some of them are Baptists, and the Baptist clergyman comes over and has his communion for those who are Baptists; and the Episcopalian clergyman comes over. We have a chaplain who is a Congregationalist; and then there are Presbyterians; but we try as far as possible to banish from the teaching of the school anything that is sectarian. We insist very strongly on the religious side of it, and we have instruction in the Bible as a part of our regular course, to show the development of the races—of the Hebrew race—as illustrating what the black race must attain, from a lower code of morals working up to a higher, as illustrating what the race is passing through. But we have tried, as far as possible, to keep

the sectarian element out; and our board of trustees represents 6 denominations, none of which has a majority. I am inclined to think we have succeeded very well. At any rate we have had the warm commendations of Catholics and Protestants and Hebrews.

Q. Have you any established discipline in respect to those who make infractions of moral conduct in the school?—A. We have very little trouble along that line. In the first place, we take no student at Hampton who does not wish to come. We have at present refused two-thirds of our applications. We have, of course, now a large number of teachers through the South, and a good many teachers among the Indians of the West. They have applications from their students to come to Hampton. We send out an application blank, and certain letters come to us. We can judge pretty well, after years of experience, from that blank, which is made out in the student's own hand, as to his character; and we pass on those and, as I said, refuse about two-thirds and take about one-third. If a boy does not behave himself and does not seem to be in earnest, we say to him: "There are 4 or 5 waiting to take your place; you can leave." And if he does not seem to show earnestness, we send him off and get somebody else; so it makes it a comparatively easy thing. Of course, with our Indians, it is a little more difficult; but still with them they know that there is a continual push to get into Hampton, so that while we have to keep them farther from home, we have very little difficulty on either side. Of course, we do have a guardhouse. A boy will sometimes get a little drink, and he has to be put in there for a time to think about it; but, as I said, the discipline of the institution is very strict.

Q. (By Mr. PHILLIPS.) What are the tribes that your Indian students chiefly come from?—A. We have quite a number from the Indian tribes of Wisconsin, a good many of the Sioux, some of the Cherokees of North Carolina, and scattering from most all of the tribes in the Indian Territory, what are called the uncivilized tribes. We are not allowed to take from the civilized tribes in the Indian Territory, but from the uncivilized we take quite a number.

Q. Do you find that the various tribes fraternize very well?—A. There is no trouble at all on that score. In the earlier days of the school there was more difficulty than there is now, but now the tribal feeling is giving away.

Q. You have spoken about the ground that you cultivate. Will you give us some idea about your works and the cost?—A. Yes; we have altogether about 60 buildings now. We estimate the value of those properties at between \$500,000 and \$600,000. They have cost considerably more than that. The last 2 buildings we put up, one for the trade building and the other the agricultural and domestic science building, each cost about \$50,000, and the Huntington industrial works, which is the largest of our productive industries, cost between \$50,000 and \$60,000. That was given by Mr. C. P. Huntington. The dormitory for our girls' and the teachers' rooms cost us something over \$100,000, and we are planning now for an addition to it which will cost \$50,000 more. So I say the school is really a sort of industrial village. Instead of being like an ordinary school, it is more like an industrial village. We have a very beautiful church building, put up by a former president of our board of trustees. We do not know how much it cost, but it was probably \$50,000 or \$60,000. We should not have put up so costly a one.

Q. (By Mr. FARQUHAR.) Who was he?—A. Mr. Elbert B. Monroe, of New York. We have an excellent board—Robert C. Ogden is president of the board and devotes a great deal of his time to it. His son-in-law, Mr. Purves, is our treasurer. He left an important business situation in Philadelphia to come to us on a salary, about a quarter of what he got there. Mr. C. P. Huntington is one of our trustees. He is very much interested and has just been paying a visit to the shipyards in Newport News, and has been over for 2 days, with his wife, visiting the school. We certainly have a very excellent board of trustees, and a board of trustees who are immensely interested in this thing, and we are getting every year onto a better business basis, so that our sawmill, which has been in years past a great deal of a strain on us, is self-supporting; it was last year.

Q. (By Mr. A. L. HARRIS.) When one of your students leaves your school, an undergraduate, does he get any certificate as to the branches that he has studied?—A. Yes.

Q. And the mechanical arts that he is proficient in?—A. Yes; he gets a statement. Of course, he gets no certificate—he gets no diploma at all. We have sent out altogether between 5,000 and 6,000 students who have not graduated, and they have had a very important part in the building up of the South; no doubt about it. Many of them have been able to pursue industrial courses. They have gone back as farmers. This showing I have made this morning was only about graduates. A very much larger proportion would be farmers of that 5,000. They

have gone into the negro communities and been really leaders in those communities, or perhaps have taught school; but we are trying all the while, of course, to push as many as we can up to the graduation point, and they get diplomas and trade certificates.

Q. What are the requirements of your course for a diploma?—A. They must have arithmetic, with some little knowledge of algebra, and some knowledge of geometry—that is, not advanced at all in the mathematics; a fair knowledge of American history and geography, and a knowledge of the Constitution of the United States, and some knowledge, as I said, of chemistry and of physics, and then they have to pass through this manual-training course and the agricultural, and some knowledge of wood and iron work, and, in case of the girls, cooking, sewing, and dressmaking.

Q. Your graduates in mechanics would not be sufficiently advanced to take up a trade, would they?—A. Yes; they could take it up, but they probably would not go out directly as journeymen, but they would be better fitted probably than the ordinary trade-school scholar, because they would have had the practical work—done the practical work. For instance, we have put up a house for this Mr. Purves, Mr. Ogden's son-in-law. Seventy-five per cent of the work on that building has been done by the students. It has been very fine, nice work. There has been spent on that work something like \$15,000. And because of the practical work they have had there they would be better fitted than the graduates of the ordinary trade school to take work outside. Some of them have gone out and set up shops for themselves, and some of them have gone out as teachers, for instance, with Mr. Washington at Tuskegee. And again, there is a large number of industrial and agricultural schools and every year there is a constant demand for teachers, and a good many of them are now going into that sort of work.

Q. What do you raise on your farms?—A. We devote 15 acres to an experiment station.

Q. Please describe your experiment station; that is very important.—A. We have different blocks of land. We have one block showing shallow plowing and next we show what will come with deep plowing. We show what results from different kinds of fertilizers. Then we will show, for instance, what can be done with one kind of sweet potatoes and another kind, and the same with Irish potatoes, and then we are taking up and showing what can be done with fruit under different kinds of treatment; showing what can be done with fruit trees that are pretty well spread, for instance, and with those that are left to themselves. All that is a part of our experiment station work. We have a small farm of 4 acres, and in that we have demonstrated what can be done with that piece of land. For instance, we show that an ordinary family can get support out of it. We have a small barn, a small shed, and a small house on that, and the whole care of that small farm is given to one of our students to demonstrate what he can do in a single year in the raising of crops and in the rotation of crops himself, so that those boys and girls see from actual experiment what can be done on a small farm of 4 acres. Of course, only some of them have done it, but the others that have not actually had the thing to do have seen what has been actually done. In connection with this small farm we have a method of bookkeeping so as to indicate the money put in and the money taken out, as to what this crop has cost and what has been gotten out of it, and so on.

Q. (By Mr. RATCHFORD.) What kind of a market have you in such cases for the product of that 4 acres, for instance?—A. We have a pretty large home consumption, and then besides that we have easy access to New York and Philadelphia and Baltimore, so that we can sell whatever truck we raise. And then on our larger farm we go very largely into dairying. We consider that dairying is one of the coming agricultural industries of the South; it seems so to us. We have two herds of cows, one of 60, I think, and the other of between 80 and 90; and one is devoted very largely to the making of butter and the other to the selling of milk, so as to show them. And of course, in connection with those cows we have the proper tests to see what proportion of cream comes from each cow, so that they can see how certain cows eat their heads off and what sort of a cow it is desirable to keep. So that they are getting all the time practical instruction along all these lines in a great many ways that I can not indicate at all; it is going on before their eyes, the actual business. Now, the trouble with the blacks is very largely, it seems to me, that they do not have the chances that the white boy has to know about things and to know about business. At Hampton we try not only to have a school but to have an actual life going on such as they ought to understand about and ought to create in the communities into which they go; and they very largely create it. Booker Washington got the idea of that sort of thing, and he is now making Tuskegee a reproduction of Hampton, not merely a

school, but he is getting an industrial village there; and we have in Lawrenceville, Va., down in what is called the black belt of Virginia, a young colored man that has gone down there and done the same thing; and we have the same thing in other parts of the South. At Calhoun, Ala., we have a sort of experiment station in farm work, where there are 2 of our white teachers, and some of our negro graduates, and they have started a farm community there. They have gotten a little land, have divided it up into tracts, put negroes on it, have directed them in their farming, so that now in a locality, in a community where a negro had never owned a piece of land, we have 70 negro farms started, and the farmers have almost entirely paid for their own land; and so we are trying in various ways these experiment stations throughout the South where our graduates have gone.

Q. (By Mr. A. L. HARRIS.) Have you visited frequently these new schools?—A. Yes.

Q. Will you please state what condition they are in?—A. It seems to me that they are very hopeful. I have been to Tuskegee a number of times, and that seems to me to be the most interesting as showing what can be done by the colored race themselves. Booker Washington is a man of very much more than ordinary ability, of course, and he, with the help that we have been able to give him, and with the assistance that we have got for him in the North in getting hold of people throughout the country, has got a plant there that is worth—well, I suppose, certainly between \$300,000 and \$400,000; he has got a school as large as ours, and he is doing the same thing over again; out from him are going young people who are trained in farming; so that we have now our grandchildren and our great-grandchildren out in the field. To my mind, if this thing can be multiplied sufficiently, the solution of the negro problem will be very largely brought about. The work that is done at Tuskegee, it seems to me, is most excellent. Their energy is bent not on the academic side, but, as it is at Hampton, on the industrial and agricultural; and in most of the schools where our young people have gone we have been able to get the idea sufficiently into them so that they carry out the same thought. Now, the negro who comes out from a merely literary school thinks that the instruction in books is the important thing. To my mind it is a very small part; the question how to live is the important thing; and if I should be asked what has been the mistake in our colored schools in the South, I should say that it has been in laying stress on book knowledge and not upon the knowledge of how to live.

Q. Have you followed any of your students to the farms?—A. Oh, yes.

Q. That they have been carrying on for themselves?—A. Yes; we have a large number.

Q. Please state to the commission how you found them where they were on their own responsibility?—A. I have found some most excellent farms. I went, for instance, to a farm near Farmville—I have been to a great many, but I take this just as one instance—which is being carried on by a young woman—a young negro woman who was trained at Hampton and who went out. Her father had got a farm; he was a man of some ability himself, and he was growing old and gave it over to her. When I was there it was in the time of harvesting, and I found her employing 13 hands, paying them off, and carrying on one of the best farms anywhere in that section, living in the old plantation house which had been owned by her father's master; and the farm was very well conducted—excellent crops, hay and oats, and good-looking cattle, good-looking barns, and everything well carried on. I remember on that same trip I came along down through a part of Nottoway County, where most of the farms were entirely run out. They had a shiftless, poor kind of farming that once existed a great deal in the Southern States, and the soil was not of the best; I found there a young man, a graduate from Hampton, who was teaching school and had one of the finest fields of clover I had ever seen in the South. I found him helping his father and his sisters; and they were all out at work—the whole family were really at work on the land—and this young man had one of the best farms anywhere in that part of the country. He had fruit trees started, and was raising chickens and pigs, and was doing extremely well.

Q. Doing a general farming business?—A. General farming work, yes. I can multiply instances of that sort to show what has been actually accomplished by our men—and he was teaching at the same time.

Q. (By Mr. FARQUHAR.) In your travels and observations in the South, how many farms did you come across where black men have full control?—A. I have seen a great many, and some of them admirably conducted, too.

Q. That is, I mean independent of the growing of cotton, for instance?—A. Yes.

Q. General farming?—A. Yes. The owning of land and the possessing of farms by negroes, especially in Virginia, is increasing very rapidly. I think the census

shows—at least I have not seen the census itself; I have taken it from newspapers—but it is reported that in the last 6 years there has been an increase of a third in the holdings of colored people in farm land in Virginia alone, and I am inclined to think from what I have seen myself, and what I have heard, the small negro farmer is increasing very rapidly; as I said this morning to Governor Harris, I look upon that as one of the most hopeful signs in the condition of the South to-day, because I think the small farm is the best possible school for the education of the negro.

Q. Of course the great plantations there are owned by old families of whites. Do you find in your observation there that the sons of these old planters still manage these estates—that is, are they resident proprietors and give it personal supervision?—A. No; I think not. I should say that it has not been my observation. The large holdings that I have seen have been very largely among what have been called the poor class of whites. I think that they are getting to have quite a large holding, but I think that in parts of the South large holdings are being broken up. In large communities, what is known as the lien system of crops still prevails; it came after the war and it still prevails. Of course you all know the history of the South—that is, that the white man of the South and the negro were left after the war with almost nothing, and the white man had to give a mortgage on his land to the man who gave him his provisions for the coming year. The negro had nothing. He had to give a mortgage to the land owner for the provisions for himself and his children, on his mule and all that sort of thing. That started what was known as the lien system of crops, which still prevails in a large part of the South, and of course is really a dreadful condition of things, by which the black man mortgages his crop and everything that he has. In fact, under that lien system of crops he goes to a store, buys whatever his employer allows him to buy, and runs in debt for it. Of course he is as a rule shiftless. In many cases large rates of interest are paid, and the black man being so ignorant runs in debt every year more and more. I have known cases—for instance, take the case of a mule, where a man has paid in the rent of the mule the cost of the mule 5 or 6 times over just in a few years. At Hampton our thought has been to change that condition of things; to do away as far as possible with the lien system of crops; to get the negro out where he owns his own house and his own piece of land; and that, I am glad to say, we have accomplished to quite an extent, and our schools are pushing toward that object to-day.

Q. Do you think there is much difference between the old condition of slavery, as far as conditions are concerned, and the present store-lien system of the South?—A. No. In some respects labor was in better condition than the present condition. It is really a condition of serfdom to-day. The condition of the black in a large part of the South is really that of a serf. He has what he did not have before, a chance to move, if he can. In reality he can not move; but there is nothing to prevent his moving; but in the old time his physical condition was looked out for, and now it is not looked out for; in many respects we have there still a slavery, an irresponsible slavery, where before they had what might be called a somewhat responsible slavery.

Q. (By Mr. RATCHFORD.) To what extent does the influence of the ill-paid colored labor of the South enter into the wages of white labor?—A. I have no doubt it affects it seriously. I do not see any help for it. The wages of the colored man are very small, and as long as that is so, it must affect the wage of the white man.

Q. (By Mr. FARQUHAR.) Is it your experience that there are many whites bound up under this store-lien system, as well as blacks?—A. I would say that there were, although I can not speak definitely. Around us that system does not prevail to any large degree. I have only seen it as I have gone into parts farther South. Our community, and the community around us, is a very prosperous one. Our farmers are doing well. From the community right around—that is, taking the eastern shore of Virginia and parts around Norfolk and Portsmouth and the peninsula, the statement I do not vouch for—but it has been said that we have sent about \$20,000,000 worth of truck to the Northern markets. At any rate, there has been a very great improvement in the condition of the farmers all about us; and then the towns there, Newport News and Norfolk, have grown and are getting to be very good markets, so that our community there is very greatly improved.

Q. Do you know of any training schools in the South for the whites?—A. Along these lines?

Q. Yes.—A. There are a number of agricultural colleges that have been started. I know of some very good ones that are doing excellent work. And what seems to me is a very hopeful sign, as I have said before, is that in a number of these

white institutions a great deal of attention is being paid to industrial training. For instance, when I was in Columbia, S. C., I went out to the State University, and I asked them how they were getting on there. I spoke to a student, and he said: "People do not care for us any more. They all think of the agricultural college now." The trend I think, for instance, in the South Carolina Institute is very largely toward agricultural education. Their new college for young women goes in on that study very largely. The same is true in North Carolina. The same is true in Alabama, where they have a most excellent industrial training school for girls. The name of the place has gone from me. I asked who were attending that institution, and they said some of the daughters of the very best families of the State of Alabama were attending there. That seems to me a very hopeful sign in the South.

Q. (By Mr. CLARKE.) Will any of those schools get the benefit of the Morrill Act?—A. Yes; agricultural schools do. Oh, yes; they must get a help from that.

Q. (By Mr. A. L. HARRIS.) In speaking about the store-lien matter a moment ago—is money ever loaned to the tenant; or is it entirely goods, substance, that is furnished him?—A. Very little money is given him. I think there is in some cases.

Q. Do you know anything about the interest that is charged in case of money lending?—A. Oh! all sorts of interest. In some cases it is very large. It depends altogether; in some cases it is very proper interest, and in other cases what might be called very improper interest.

Q. What about profits on the goods?—A. In many cases they are very great. Of course, there is a great deal to be said for the man who loans this money, because the man that he has to deal with is a most ignorant and shiftless creature, and he feels that he should insure himself with a very high rate of interest, so he does insure himself; but in many cases, of course, the rates of interest and the charges for the goods are oppressive.

Q. (By Mr. FARQUHAR.) Would 3 per cent a month or 24 per cent a year be oppressive—that is, be a hardship down there?—A. No.

Q. (By Mr. RATCHFORD.) In every case a man who borrows money has, of course, to give security for it?—A. His crop is security.

Q. How about his farm, his land holdings; is that accepted as security?—A. Yes; everything; his furniture, his mule—everything about him.

Q. Well, in that case the man who lends the money is at least secure of the principal, as much so under a low rate of interest as under a high rate?—A. Yes.

Q. (By Mr. PHILLIPS.) Does he not have to take the chance of the crop?—A. He has to take the chance of the crop. If the man is a worthless sort of laborer, the likelihood is he would not get very much out of him.

Q. Men who have money to lend in agricultural communities in the South, do they prefer to be secured by crop or by the land? I ask that question for the reason that a previous witness before this commission has stated that it was almost out of the question to try to borrow money on land values, and that it had to be borrowed on crop securities?—A. I think my own experience is in that line.

Q. (By Mr. A. L. HARRIS.) Where does this situation obtain to the greatest extent; in the cotton-raising belt?—A. Yes.

Q. You say that you teach your students to avoid, as far as possible, the crop-lien system. To what extent have they been successful in managing their affairs without using the crop lien?—A. I have never known them to go under the crop-lien system to any great extent, any of them. Perhaps they have done it, but I have not known of any cases.

Q. Do they go back to the farm and raise cotton only, or do they diversify?—A. As a rule, diversify their crops. Wherever I have known them, they diversify their crops.

Q. Do you believe that is the only hope for the South, diversification?—A. No question about it; it must be so.

Q. From your observation are they able to raise such stock as they need, such as mules, horses, and cattle?—A. I do not think there is any difficulty at all, in any part of the South that I have visited. I have information only about Alabama, North and South Carolina, Virginia, and Maryland, but I have seen no difficulty at all.

Q. There is no excuse for paying \$125 for a mule then when they can raise them for \$60?—A. No.

Q. Do you think that has had something to do with the present depression of agriculture in the South, especially the cotton-raising States?—A. I do not question it at all. I heard a young colored man say in Alabama that he hoped cotton

would go down to 2 cents, if it was necessary to bring about different crops. I think that has been brought about by cotton, and some very good results come out of it.

Q. Well, is it possible to inaugurate diversification now without the cotton to secure their coming year?—A. On most of those plantations the negro is allowed a little land for his own private use, and what we have encouraged them to do is, that while they have been going on with the cultivation of cotton for the master, or for the owner, that they should cultivate their own supplies, and that they have done in a large number of instances. For instance, in Tuskegee, we have had every year a farmers' conference, where we brought in large numbers of blacks from communities around there, while hundreds of them have come in, representing 20, 25, or 30 counties in Alabama, and some other States, and almost all of these delegates to this conference have commenced in a greater or less degree this raising of their own crop supplies; what is true there is true of almost all, and they have commenced to diversify crops.

Q. Would a larger number of your male graduates become farmers and mechanics if the demand for teachers was not so great?—A. I suppose they would. We have thought in the past that the best thing that our students could do would be to go in the public schools of the South, where they get a salary usually of \$25 a month for sometimes not more than 3, 4, or 5 months, and there get a little work in the little church, and at the same time build their houses and cultivate their little piece of land. In that way they have a certain amount of money coming to them from their salary, and they are able to present an object lesson to the community, the decent living by farming, which has made them most valuable. A very large number have gone into the country and have done that thing, and they are independent. Really they are the moneyed people among their own race in the communities to which they have gone, for the small amount of salary, though it was small, gave them a certain amount of ready money that they could put on their land, so that it was really a help to bring up the community. Our thought has been to establish these centers just as far as possible, and we have established them in certain counties of Virginia, for instance. We have been able to make a very remarkable showing. I could tell you of one county, for instance, where we sent between 40 and 50 of our graduates. Most of them went in and started schools such as I have spoken of, and cultivated their land. The result is that where 16 years ago the colored people of that community owned no land to speak of, to-day they pay one-fifth of the property tax of the county, and where there has been that increase of property or land holdings there has been a corresponding decrease in crime, and the character of the houses and the churches and everything has correspondingly increased.

Now, I consider that it is possible, if you have the right sort of education, and send into counties just that sort of people who will make just that change—wherever people of that sort go, there is no trouble about race problems at all; in that county, and in any other counties where our graduates have gone, there has been almost no race trouble at all. They have brought to the community the thing that the community needed and what the community wanted. For instance, Booker Washington had seen that there was no brickkiln at Tuskegee. They had none when he went there, and it was the thing they wanted, and he started one, and they came to him for brick; he started a blacksmith shop, and he had the best blacksmith shop in the community. He started a printing office, and after a little while a Democratic paper came out and tried to get better work; they found that they could get cheaper printing at that printing office than anywhere else; and they came out in an editorial and said they were going to have work done in the negro school. That is the way they need his work there, and there is no man in that part of Alabama that is more respected, both by white and colored people, than Booker Washington is. I could tell you of a great many communities where our graduates have gone and accomplished just the same thing as was accomplished down there. There is no race problem in such places.

Q. Would not the tendency along that line be that if the white people moved back the colored people would occupy the territory where it is quite densely populated by them now? For instance, take the black belt—is it becoming more densely black, and are white people moving back from it?—A. I think that the negroes are moving into communities by themselves very largely. I think that that is the natural process. There is a large part of the country, of course in the South, where whites can not live and the blacks can live. Take it along the river bottoms where it is low and hot; those are the communities into which the blacks are moving to-day very largely, where the whites naturally take the upper lands. I think the movement is pretty marked toward black communities, and the self-respecting blacks naturally move into communities by themselves, because, with

the race feeling that there is, they want to get by themselves, and they move away from the whites; so, as I said, I think that process is going on quite rapidly.

Q. The probability is that in the course of time a great portion of the Southern States will be settled almost wholly by the blacks?—A. Yes; I think so.

Q. It has been stated before this commission that if the labor of the colored people is not controlled by the whites, the territory along the black belt would become a waste; that they would not of their own accord cultivate it; that they have no experience about that. Is that true of the ignorant people who have not the education? It is not true, of course, according to your statement, of the educated.—A. They must have education from some source. Now, what I hope very much is that the South will adopt a system of industrial and agricultural instruction for its masses, both white and colored. I see that the superintendent of public instruction of Virginia is going to advocate it very strongly in his next report. I have been impressing it upon him for years. I think there is no reason why, if we make our public schools what they ought to be—put, for instance, the right sort of teachers into these public schools—why we can not have black communities, if they have the right sort of instruction.

Q. Now, without instruction of the white would not the colored race retrograde?—A. I think they would retrograde. I do not think there is any question about that. I think they need just that direction and help which comes from the white race.

Q. There is one question I desire to ask: In regard to the capability of the Indians under the reservation system and the negroes in regard to instruction, both morally and intellectually?—A. The negro race was very much better fitted by slavery for the reception of civilization than the Indian was by the reservation system. The slavery, with all the bad in it, taught them three things: Taught them knowledge of the English language; it gave them some regular habit of industry, and it taught them something of the Christian religion. In the reservation system of the Indian there was no show for a white man. No white man could go there except with a permit from the Indians, and the result was that it kept them in barbarism; he was fed by the United States Government and became a pauper, and the result is that when you put an Indian and a negro side by side, the negro is very much better fitted to receive civilization than the Indian. I think in capacity the Indian is not lacking, but the conditions have been much more favorable for the blacks.

Q. (By Mr. CLARKE.) Does public opinion of the South favor education of the negro, generally?—A. That is a very hard question to answer. I should say that the best public sentiment of the South favors it. There has been a great deal said against the education of the black, but in spite of what has been said it is true that the Southern people have done extremely well in the education of the black. They have contributed, it is estimated, no less than \$100,000,000 since the war for public schools among the blacks, which is, perhaps, the best answer to your question. There are a great many who would say that they ought not to be kept up at all, but in spite of all that has been said this is what has actually been done, which I think a fair answer.

Q. Does the Hampton Institute receive any contributions from Southern churches?—A. No. I say none—we have received a few for our Indian work. For instance, from the city of Richmond we have had a scholarship for \$70 for a number of years, and from New Orleans; but we have felt that if the Southern people kept up the public schools that is all we ought to expect. It is right to call upon the North for the supply of teachers, so we have made no attempt to secure funds for Hampton from the South.

Q. Is there any part of the South where the whites and blacks are educated together in the same school?—A. There are a few institutions, but very few, I think.

Q. As a general thing they favor separate schools?—A. Yes.

Q. Well, do they maintain as good schools and as many of them for blacks as for the whites?—A. Perhaps not quite as good. In some cases, however, I think the schools are better for the blacks than for the whites. I think, in fact, that it has been stated by superintendents of public instruction that, owing to the schools that had been separated receiving the help of Northern funds, there were better trained teachers for the blacks than whites. I think that is true in some cases. As a rule the white schoolhouses are probably better than the colored schoolhouses, and the salaries of the teachers are usually somewhat in advance.

Q. Does education of the blacks spoil good laborers, blacksmiths and servants, and make poor teachers and professional men, etc.?—A. It depends upon the kind of education. I should say there is a sort of education which I consider does that sort of thing. I do not think the right sort of education does.

Q. You think with a large admixture of industrial education that book learning has the opposite effect?—A. I think so. My own impression is that industrial education gives a common-sense knowledge of things that keeps the negro from getting what we are accustomed to calling "the big head."

Q. You think that the custom of educated men and women of the negro race who settle in the different parts of the South is to inspire colored people to get learning and improve their condition?—A. I think very decidedly so. The communities of which I have spoken—for instance, around Tuskegee—there has been a tremendous change. It is very natural, of course, that after the war the negro should feel that with education he should get off from the land and out of all sorts of work of the hand; when we started with Hampton, which was 31 years ago, there was a very strong opposition to it on the part of the blacks. We were bitterly denounced by the blacks themselves. It was said that we did not believe that they were capable of anything higher than being hewers of wood and drawers of water; we had a book full of clippings from the negro press; but as the years have gone on their opinions are changing very much.

Years ago no respectable negro family in Washington, for instance, would have sent the children to Hampton. Now the feeling is very different, and that is one of the very hopeful signs among the blacks. They are beginning to realize that their salvation does not lie so much in politics, but that it does lie in knowing how to do something.

Q. Would this political proscription prevail against the blacks if they were educated?—A. No; I am not inclined to think so. To-day, where our graduates have gone and have land holdings—where they have had a part in a community and own something—they have had almost no trouble. Of course that is not universally so, but we have had almost no complaints from our blacks in the South.

Q. You think, then, the objection is not so much to the color of their race as it is to their ignorance?—A. Yes; I should say that was true. Wherever our men have shown themselves to be respectable, to have ability, and have gotten property, they have won respect, and I am inclined to think that it is accorded quite as much to the young men of the black race as it would be to the young people of the white race. I say to our boys in the South to-day that if they are of the right sort I believe there is just about as good a chance for them as there is for the young people of the white race.

Q. Is there rivalry between the races in trades, and in fact in all industries?—A. Oh, yes; there is some; but the truth of the matter is that the South is such an undeveloped country that for years I do not think there is any great danger of rivalry. Of course, there will be none in agriculture for a great many years to come, and, as was said this morning, in the matter of trades in the smaller places there will be no special rivalry. The South needs building up so much, and there is so much chance for every man, where he knows how to do anything, that I do not think we are going to have any great rivalry. Of course, in the larger cities it will come. What we are trying to push our students to do is to go into the country districts and into the smaller places. That is where the great mass of the negroes are living, and they need leadership, and there we have great chances for the blacks every way. We are continually pushing the matter in the South and in the North that the negro should go into the country and not in the city.

Q. Are white laborers willing to work with black laborers in the same shops, same gangs?—A. That depends on where it is. As a rule, where Northern capital has come I think the black man has had perhaps less chance. There are some very great exceptions to that. But the Southern white man has learned to deal with the negro; he knows how to employ negro labor, and a Northern white man, as a rule, does not. Mr. Huntington, for instance, of the shipyards at Newport News, has given most excellent opportunities to negro labor; but I have talked with, for instance, the heads of cotton mills throughout the South—men that have come from the North—they do not know how to deal with the blacks, and the result is that in a great many cases they throw them out and employ white labor, which they are more familiar with. I think it is quite noticeable that where Northern contractors and Northern laborers come there, there is more of the push against the colored man.

Q. Are the various trade unions composed of both races?—A. To some extent that is true. They are allowed in, certainly, to some limited extent. I can not speak from personal observation much in regard to that.

Q. (By Mr. A. L. HARRIS.) Do you know of any reason to be discouraged with the progress that the negro is making in the common school of the South, considering his surroundings?—A. No; I think there is very little reason. To my mind, he has made quite remarkable progress. When you consider that he came out

from slavery with nothing, and consider what he has in the way of property to-day, I think there is very much reason to be encouraged rather than discouraged.

Q. You think the common schools, then, are becoming more and more useful to the colored people?—A. Yes; I think that is true, as a rule. Of course there are exceptions to all that I can say. In certain places and parts of Virginia to-day there seems to be a movement backward. They are discouraged; they think education has not brought them what was expected; so there is quite a retrograde movement undoubtedly in some parts.

Q. They expected a change too soon?—A. Yes, altogether; but take it all through the South, the movement is forward, and I look to the public-school system, both for white and colored people, as one of the very great means for improving the whole community.

Q. Is the amount of money contributed for that purpose increasing in the South every year, making efficiency better?—A. I should say that it was, generally. Of course there has been quite a struggle on the part of some of the States to separate and have the taxation of the whites apply only to white schools, and that of blacks to black schools, but, as far as I know, this has not prevailed to any extent. It seems to me, as I have said before, that the hope is in introducing something of industrial and agricultural training into our public schools; but even as they have been I do not question at all their value, and the people have attributed a great deal of what came since the war among negroes to education. I think that what has come is a very natural result. Of course slavery kept a certain element of a community, which has been let loose, under control—very dangerous and troublesome portion of the community, too. While it is true that a certain element of the negro race were very much better under slavery, there is another element that has come up and located in a community, and you see the people that have gone ahead. My predecessor was accustomed to say of the negro race since the war—that he thought there was about one-third that had gone down; that is, slavery held them up to a higher level than they are to-day. That is the disturbing element of the negro race. There is another third that have stood about where they were, and another third that perhaps have gone up. That is, of course, an offhand statement of his feeling about the black race. We do not hear so much about the part of the negro race that has gone up. We hear a good deal, of course, of the turbulent element, which is not controlled to-day as in the times of slavery.

Q. As a rule, do the colored people of the South embrace the opportunity to obtain education that system gives them?—A. Yes.

Q. (By Mr. CLARKE.) Do the colored people through the South incline to learn trades as they had to in slavery days?—A. They have not yet. I do not think that could be said of a large number of them, but such schools as Hampton and Tuskegee have 3 or 4 times as many applicants as they can receive. These two are the only ones where trades are taught to a very large extent.

Q. Well, trades can be learned without going to school. How is it in the communities? Have you observed any tendency among the colored people to learn trades in the old way?—A. There is very little chance for them to-day. You see the plantation was in itself a sort of trade school, but there is not as much chance to learn trades such as were given on a plantation. All that has been stopped, and it seems to me a very great misfortune.

Q. (By Mr. PHILLIPS.) Is the tendency for people in the North to go South and take up lands and farm much? Do you find many people go from the North, in a way to injure agriculture?—A. Yes; there is quite a large movement. I have noticed it in certain counties in Virginia—quite extensive. I heard of quite a movement in Michigan not long ago. There were excursions from Michigan to the South; special rates were given. The feeling, as I said, was so strong against it on the part of the people of Michigan that a movement was made to prevent these railroads from giving these special excursion rates. There has been quite a movement from certain parts of the West to the South.

Q. How is it with foreign immigrants engaging in agriculture or other pursuits in the South? Do you have any considerable per cent of foreign immigrants?—A. There is some, but I do not think it is very great. Of course the Italians come into Louisiana somewhat, but the larger part, of course, of the foreign element comes from higher altitudes, cooler parts, so they most naturally seek Western States rather than go South.

Q. (By Mr. RATCHFORD.) You spoke of the tendency of the colored people of the South to colonize and get into communities for themselves. Do you look upon that tendency with favor?—A. Yes. I think all that has got to be. The State ought to take cognizance of that. They ought to establish proper schools among these people. And yet I look upon the certain movement of separation of the black and white races as a very desirable thing for the improvement of the black

race. I can not help but feel, for instance, in the matter of churches, that while there has been a great deal that is very poor, their having churches by themselves has taught them how to organize. It has developed a certain life among themselves, so that what we call race prejudice has had its very great advantage as well as its disadvantage; and so I look upon this question of separation of whites and blacks as having very great gains.

Q. Do you think there is not a greater danger of perpetuating that race prejudice by separating into localities or communities than there would be if assimilated together?—A. No; I think not. I think with the feeling that there is between the white and black races to-day, it is rather an advantage than a disadvantage to have them, a certain part of them, by themselves. I have watched that in certain communities. For instance, in Virginia certain of our graduates have started small negro villages outside of the city of Portsmouth. One of our graduates has considerable business ability and has started a little village, bought land, and has persuaded others of the blacks to take stock; and we have sent our boys there and built houses there; and now that little negro community is a very self-respecting—excellent community. I think a great deal of that sort of thing can be done to advantage, while I do not think it is desirable that the black race should be entirely separated from the white race. I think they need the help that is going to come, and yet I think that certain experiments of that sort can very properly go on.

Q. If colonization on a small scale would be advantageous to the colored race, why would not colonization on a larger scale be more advantageous still? If that would be advantageous to the colored race, and they would develop a prosperity under that system more rapidly than under our present system, why would not colonization on a larger scale be advantageous to a greater extent?—A. Because I believe very thoroughly with Sir Henry Maine that there are certain races that have got to push the world ahead, and that other certain races need their help in order to move along. I believe that the white race has the power of initiative and that the black race needs help and must have it.

Q. Well, is not that one of the best reasons why the races should assimilate and live together?—A. I feel to a certain extent that that is true, and yet, I think for the present, while the negro is developing, while he is finding out his own powers, he has got, for the time being at least, to be by himself, just as in the system or matter of negro churches. There is in him naturally, as a result of slavery, an inclination to look upon the white man as the one on whom he has to depend for everything. I see at Hampton all the while that those blacks expect I will do everything for them—a kind of patriarch, to look out for everything. Now, they have got to learn for themselves, and in order to learn to do that, I think they have got to be to a certain extent left to themselves, and so for the present I do think that this is a matter, planning for the negro community, that is desirable. Still, at the same time, I think it is very important that they have public schools, and that they have the general direction of the whites in the way of government and so on.

Q. In short you believe that, regardless of the question of colonization, their salvation depends upon education and agricultural training, mechanical training, etc.?—A. Yes.

Q. Does the social and moral character of the black man improve in proportion to his education?—A. Yes; I think so.

Q. Invariably?—A. I would not say invariably. I think so, though. My whole feeling is along that line. I was reading, coming over in the cars this morning, a book by Professor Dubois, a colored man, a graduate of Harvard, who has just gotten out a book on the Philadelphia negro, and I was quite interested in the statement that he made there, that in the city of Philadelphia the convictions for the greater crimes were among the illiterate; that there was considerable of smaller crime among those educated, but when it came to the grosser crimes, for instance, in the case of larceny, it is 31 per cent; in the case of assault, 34 per cent; in the case of sexual crime, it was 65 per cent. I am inclined to think that my own experience would tally with this; that just so far as a man had some better thoughts, had something to think of, in other words, he was liable to be the best.

Q. That is as true of the black race as any other?—A. Yes.

Q. (By Mr. FARQUHAR.) In your observation down there, do you think that the active participation of the negro in politics in the South has been very harmful to his condition?—A. I do.

Q. Do you not think that is really one of the most harmful ambitions that has been developed since the war, in the black man?—A. I do. He has been made to think that his salvation is to come through politics and not through work.

Q. (By Mr. CLARKE.) Are there not a great many white people made to think in the same way?

The WITNESS. That is true; more true in his case than in the white.

Q. (By Mr. PHILLIPS.) Do you think the race prejudice is on the increase, or is it diminishing, from your observation, in the South?—A. That is a hard question to answer. I think in some places it is on the increase. I think as the negro comes up that there is a certain element of the South with which he comes in competition, as he did not before. I should say among the best element of the South there is no more; and it seems to me that one of the vital points is to have education for both whites and blacks in the South. As far as I have been able to observe, where there has been difficulty, it has been where there was ignorance on the part of both whites and blacks. There is a certain element of white people in the South who have no chance for education whatever. They are emotional, and it is among those that our troubles are had. If you send a black boy into an intelligent white community, he very seldom has difficulty. That is my experience.

(Testimony closed.)

CHARLOTTE, N. C., March 13, 1900.

TESTIMONY OF MR. J. H. M. BEATY.

Professor, Clemson College, S. C.

The subcommission of the United States Industrial Commission met in the rooms of the Southern Manufacturers' Club at 10.45 a. m., Mr. Smyth presiding. Mr. J. H. M. Beaty was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. SMYTH.) What is your name?—A. J. H. M. Beaty.

Q. Your place of residence?—A. Clemson College, S. C.

Q. I understand you have a paper which you wish to read to us first, and will then be prepared to answer questions which we may ask you with reference to the work at Clemson College. We will now hear the paper.

The WITNESS. In accepting the invitation to appear before your commission and give some information concerning the mechanical and textile industrial training schools there, I thought best to compile it in the form of a paper, which I shall read, and afterwards answer any questions which I may be able to. [Reading:]

Clemson College, the agricultural and mechanical college of South Carolina, was established in 1893. This college does not receive any direct appropriation from the State, but is allowed the "inspection tax" of 25 cents per ton on all fertilizers manufactured in the State. This amounts to from \$40,000 to \$65,000 per year. The interest on the Clemson bequest amounts to \$8,512 per year. It receives from the Federal Government the following amounts: From the "Morrill fund" \$12,500 and from the "scrip fund" \$5,000 per year. Taking the "inspection tax" at \$50,000 the annual support of the college amounts to something like \$71,012 per year.

During the 7 years of its existence it has graduated 72 students. The average cost per student per year is \$20 less than the average agricultural and mechanical colleges in the United States.

The college is divided into three separate departments, viz: Agricultural department, mechanical department, and textile department.

The agricultural department employs 6 instructors and has 45 students. The mechanical department employs 7 instructors and has 88 students. The textile department employs 4 instructors and has 48 students.

Freshman and preparatory classes are not included. About 15 other instructors are in the academic work of the college.

The average salary of instructors is \$1,208. The average working time for each instructor per week (class-room work only) is 28½ hours. The total enrollment of students this year is 435, making an average of about 13 students to each instructor.

All students have 80 hours of work per week—15 hours of class-room work and 15 hours of practical work.

All regular students pursue the same studies in the freshman year. At the beginning of the sophomore year each student elects one of the three courses, agricultural, mechanical, or textile. No attempt will be made to report the organization and working methods of the agricultural department, because the

request was made for information about the mechanical and textile departments only.

The mechanical department has been in operation since the founding of the college. This course is subject to a division in the third year, the electrical and civil engineering courses branching out from the mechanical engineering course at the beginning of the junior year. The building set apart for this work contains about 30,000 square feet of floor space, and in the building are the divisions of woodwork, forge, and foundry shop, machine shop, drawing rooms, and mechanical laboratory. In the theoretical work, freshman year, the time is devoted exclusively to such culture studies as mathematics, English, history, etc. In the sophomore year the studies taken up bear either directly or indirectly on engineering. In the junior and senior years the student specializes entirely in that division of the mechanical department which he has elected. Practical work in woodwork, forge, and foundry begin in the freshman year. In the wood shop the students work entirely from drawing and do general woodwork construction, pattern making, and cabinet building, together with the setting up and handling of the various machinery necessary in a general wood shop. In forge work the students are instructed in the manipulation of iron and steel, beginning with the making of exercises laid out by the instructor, and afterwards to the making of hammers, chisels, lathe tools, and various other articles for use in the machine shop. The classes in foundry work cast several times a week, and make all the brass and iron castings used by the advanced students in the construction of engines, dynamos, motors, etc.

Machine-shop practice is taken up in the junior and senior years. The students are given exercise work at first so that they may become familiar with the different machines employed. After a short time they begin to finish the casting sent in from the foundry. Then commences the instruction in the building of small engines and the winding and finishing of dynamos and motors. All this work is carried on by individual instruction by thoroughly technical instructors.

The work in the mechanical laboratory is very valuable to one that expects to follow engineering as a profession. This laboratory is equipped with air compressors, water motors, electric motors, pumps, engines, boilers, testing machines, etc. Ample facilities are afforded the student for detailed study of various machines that must be used by him in the practice of his profession.

Besides the work mentioned above in theoretical and practical mechanics, the students are given a series of lectures on patent laws and the laws of contract and specifications.

The object of this mechanical course is to give young men who have already received the equivalent of a high-school education as broad an engineering education as four years of systematic technical training will permit. It is believed that every engineer should have a broad general education, coupled with a technical education, and that he should receive special training along the particular lines of his chosen work, and further to develop in him, an intimate knowledge of shop practice and manufacturing processes.

ELECTRICAL ENGINEERING.

The course in electrical engineering is a superstructure, to be built upon a foundation of mechanical engineering. The work is carried on by lectures in the class room and individual instruction in the laboratories. The laboratory used for the measurement of electric currents, the calibration of various electric instruments, etc., is handsomely equipped with the most delicate and expensive instruments.

The instruments used in these tests are so delicate and so susceptible to electric influences that the building had to be placed by itself and contains no magnetic material in its construction. The instruments are entirely of brass. The students use the equipment in this laboratory in testing for and in correcting the slightest errors in various delicate apparatus in daily use in all electric plants. This work is very practical.

The dynamo laboratory is equipped with various types of dynamos and motors, direct-current and alternating-current machines, single, double, and three-phase machines. In fact it contains all kinds of electric machines likely to be found in a modern electric plant.

The students operate these machines just as they would be operated if used for practical purposes. They are run independently and in connection with other machines, both for lighting and power purposes. The students test the efficiency of each machine under various circumstances and note the results. They also test for practical errors in dynamos and motors, these machines having been

deranged by the instructor previous to the students coming to the laboratory. In this way the student is brought face to face with data, facts, and practical information which otherwise would take him years to become familiar with. Fully one-half of the motors used for power in the various departments of the college were built in this laboratory.

The aim of the instruction given in electrical engineering to students taking the mechanical-electrical course is to fully and thoroughly ground them in the essential theories and principles of that profession, and to teach them the design, construction, care, and operation of dynamo-electrical machinery. We do not hesitate to recommend for responsible positions as electricians, in charge of electric-light and power stations, etc., those young men who have successfully and satisfactorily completed the course of theoretical studies and laboratory practice prescribed in electrical engineering, provided they have had also the requisite amount of training in mechanical engineering and shop practice. We hold that electrical engineering is a superstructure to be successfully built only upon a foundation laid in the mechanical engineering class rooms, laboratories, and shops; that without this essential preparation no man can be an electrical engineer worthy of the name.

CIVIL ENGINEERING.

The course in civil engineering is coordinate with that in mechanical engineering. The instruction in this course begins with plane surveying in the sophomore year. It includes the general principles and fundamental operations of surveying with compass, level, and transit. The object is to make practical surveyors, familiar with both the mathematical principles and the art of combining the theory and the practice. The field work includes surveys of extensive tracts of land, of which the areas are computed and accurate plats are drawn. Experience is given in numerous problems of laying out and dividing up lands and in locating intricate irregular boundaries. Ample training is thus furnished for the needs of agricultural students, and a good preparation is given for the higher work of the engineering course.

During the junior year the class is employed in the study of the higher forms of surveying, highway engineering, and the theory of railway construction. Among other subjects considered are the location, construction, and maintenance of country roads and city streets; advantages of various materials for road coverings; effects of grades and surface upon the cost of transportation; preliminary and location surveys for railways; computation of earthwork, etc.

During the senior year the theory of railway engineering is applied to the actual surveys for a line of railroad a mile or more in length. The present senior class has been working on a line from the college to a point on the Southern Railway about $1\frac{1}{2}$ miles distant. The work is now completed and a track will soon be laid to the college. The students are given a large amount of work in laying out waterworks for towns and cities, building of reservoirs, calculating their stability, cost of construction, etc.

This outline of the work in civil engineering will serve to show that the aim of all the instruction is to so combine the theory and practice that the student may be qualified at the completion of the course to turn his knowledge to practical account in one of the many and varied lines of civil engineering.

TEXTILE DEPARTMENT.

I will state that I am in charge of that work there, and if I bear a little heavier on it than on the others you must remember that I have been in it for several years and am a little more familiar with it than with the other departments.

In the spring of 1898 the trustees appropriated from the general college fund the sum of \$15,000 to establish a textile school. This school has been in operation since November of that year. That is, the theoretical instruction began in November. Our machinery was not in place until the first of last March, because it was late in coming in. The building and equipments will aggregate about \$30,000, about \$12,000 of which was donated in machinery by various machine builders.

The first year of this course is in common with the freshman year in the other courses. In the sophomore year the student is allowed to specialize his studies only to a limited extent. The course is not intended to follow special lines too closely until the third year, for two reasons:

First. So that the student may get a good general education; further to familiarize himself with certain branches of mechanics, which he will most assuredly need in millwork, and to give as scientific a foundation as is possible in the time allowed.

Second. To prevent any narrowness of education which is so likely to arise from specializing too early in industry.

Therefore, the first and second years of this course are devoted to mathematics, English, history, natural philosophy, and chemistry in the theoretical work, and to woodwork, forge, and foundry work, descriptive geometry, freehand and mechanical drawing in practical work. This training in freehand and mechanical drawing is very valuable to the future work in designing and sketching of jacquard patterns, a great deal of which is original and must be accomplished rapidly, and is freehand only. This work could not be accomplished without some previous knowledge of the art of drawing. Thus the eye for proportion and for the detection of slight variations in lights and shades is developed. In fabric design both these points are essential, and no practice is better to develop this faculty of the human eye than freehand and mechanical drawing.

The chemistry taught during the first 2 years of the chemistry course is general chemistry. In this is laid the foundation for the future work in industrial chemistry, especially that part of it which relates to dyeing. The Germans have set us an example along this line of industrial chemistry which we can no longer afford to ignore. Hermsdorf, the celebrated German chemist, was the first to discover the process to make an absolute fast black. By their expertness they have also shown us how to increase the value of raw materials by utilizing their by-products. For instance, they increase the value of coal tar by manufacturing from it a medicine called phenacetin, thereby increasing the value of the raw material some 10,000 times.

The third and fourth years of the course are devoted to the study of textiles, with a continuation of chemistry, higher mathematics, the steam engine, mechanics, mill construction, fire protection, and machine-shop work. The study of textiles includes carding, spinning, weaving, designing, and dyeing. In carding and spinning the students make a special study of the machines in this division of their work. They are instructed in the design, construction, care, and operation of these machines. They are required to tear down, rebuild, and adjust these machines, and, after setting them up, to operate them. They are instructed in all the calculations relating to the machines themselves, and also to make any required change in the machine to produce certain given results in the stock in process of manufacture.

The first instruction in weaving is given on handlooms of special construction. The power loom runs too fast for the new student to observe and understand its motions. These handlooms are generally 4 by 4 box looms for weaving either white or colored fabrics, and are fitted with 30 harness shedding engines, thus giving all classes of weaves that could be got from a power loom, with the same number of harness and boxes. The advantage of the use of these looms is that every motion is operated by hand, necessitating an understanding of the various motions before the student can weave the fabrics given him to produce. In this case the student is the real machine weaving the cloth. A continuation of this work must necessarily fix the mechanism of a loom on the student's mind.

On the power looms, as on the handlooms, the student, beginning with his squared paper, brushes, and paints, designs, under instruction, the fabric he is to weave. Then he makes his calculations as to the counts of the yarn, the number of ends, and the colors to produce it. He makes up his warp and arranges his loom, setting and adjusting till the machine is working its best.

In the study of the power loom the principal points to be learned are how to take advantage of power so as to be conducive to economy and effect and to the production of more elaborate designs. It takes the man entering the mill years to get the same experience on the variety of makes of looms and the variety of products that the student gets in a school of this kind in 2 years. Presuming that the South will gradually get on to finer work, this school is preparing to give full instruction in Jacquard weaving and card cutting. We have recently added 1 Jacquard and 1 Leno loom to this department of the college.

In teaching dyeing the idea is to teach it as a science and not as an art. It is shown that the so-called "secrets" of dyeing are only the chemical laws of affinity, and that colors are produced by combining some or all of the prismatic colors in various proportions.

The student is given a considerable amount of work in color harmony (the study of effects by the harmonious combining of colors), color matching, experimental dyeing in the laboratory, and practical dyeing. This whole course is based on a thorough course in industrial chemistry.

General instructions.—As far as practicable the student is instructed in mill architecture, mill construction, and fire protection as recommended by the best insurance companies.

The commercial features of the mill are discussed to a limited extent. A series

of talks are given on the more important commercial cottons of the world. The student is taught how to choose cottons by their length of staple, spinning qualities (by the feel of the fibers), and color, so as to produce a given quality of yarns.

IDEAL INDUSTRIAL EDUCATION.

In the language of Aldred F. Barker, head master textile department, Bradford Technical College, delivering a lecture to the Bradford Art Gallery (England), December 22, 1899:

"The three stages of education may be defined as: (1) the home life, (2) the school and college life, and (3) the communal life.

"In the home the child should be subjected to an environment to which all that is best and desirable in it will respond. A happy life, indirectly calling forth the innate capabilities of the child, is to be most desired, coupled with the teaching of obedience.

"In school the youth should be subjected to an environment in which his physical, intellectual, and moral faculties are gradually called into full play, and in which obedience merges into desire to emulate good example. Up to 14 years of age no specializing of subjects should be allowed—i. e., a variety of subjects should be taught with distinct idea of teaching general truths only, of inculcating good habits of work, such as accuracy and thoroughness, and of affording the opportunity of judging the innate capabilities of the youth. Then the particular subject for which the scholar has shown, or is likely to show, preference should be used as an educational medium, merging, so far as possible, the particular into the general, subject into method. As the youth gradually unfolds merge obedience and example gradually into self-command, developing the powers of reasoning and judging toward will power and right action as the end of all education. But educational agencies may be viewed from another standpoint. Undoubtedly elementary education should have as an ideal the conformation of the individual to type, while higher education should carry this conformation on, but, having secured the necessary stability of character, should endeavor to inculcate a spirit of originality and diversity, not antagonistic to but based upon conformity to type, which may form a suitable basis for natural selection to work upon.

"The home, school, and college life do but prepare for the practical everyday life of the world, which is really the training college of life. Evolution toward a higher ideal depends upon how we are prepared with the past experience of the race to meet this everyday life, and what use we make of it. Through the fresh experience we are capable of gaining, we may add to the sum total of human experience—i. e., we may add another step to the ladder of human progress."

ADVANTAGES OF INDUSTRIAL EDUCATION.

"The chief advantage of industrial education is that it is the subject to which the majority of our population most readily respond, and, therefore, the subject by which the development of the majority of the race may best be assured. If the innate capabilities of the individual are very limited, industrial education may still show him how he may make the best of, and gain the most from, the life which he has to lead. This is the minor work of industrial education.

"But the great work for industrial education is the idealizing of industry, the raising of industry into practical sciences, which shall call forth the energies and capabilities of the best of our industrial population, and keep many who at present run to waste in the arts and sciences engaged in the industry to the great and lasting advantage of themselves and the whole community.

"Last, but not least, the value of industrial education as a direct preparer for earning one's daily bread must not be overlooked."

The first principles of technical training are system, accuracy, and thoroughness. In all the work performed by students the results must be accurate, whether it be in producing a definite-sized piece of wood or metal, or a certain standard of cloth, or the weighing of the ten millionth part of a grain in the delicate balances of the laboratories.

In the case of a mechanical student, he is taught to use the proper tool or machine for each kind of work. He is also taught the theory of engineering of whichever kind he may be studying, together with the fundamental principles of the various machines used. He thus becomes familiar with the construction of machines and the handling of them. Studying types and not certain given machines makes him familiar with classes of machinery.

The technically trained man is enabled to differentiate between the important and the unimportant. The technical mechanic knows that a machine is merely a

device composed of accepted forms of mechanism that will enable given forces to accomplish definite results. From his familiarity with the elementary forms of machinery and his knowledge of what they are to accomplish he is enabled to understand new machines that may come under his attention. Understanding his machines, as he does, and the nature of the materials he is working, he has an immense advantage toward accomplishing the desired result. The advantages mentioned in regard to the technical mechanic in handling machinery applies as well to all technical men in their respective lines—to the blacksmith who understands the structure and composition of the material he works, to the agriculturist who has knowledge of the laws that regulate the kingdoms out of which his materials are taken, to the horticulturist, and others as well. These schools develop the scientific side of the trade or business with which they are connected.

The industrial training schools are the workman's best friend. This is proven every day, by persons of our own knowledge, who are filling good positions as railroad engineers, bridge constructors, shipbuilders, etc., who, but for their industrial education, would probably be laborers at small wages.

Numerous young men of my acquaintance who have graduated at Clemson College are now occupying positions of responsibility and commanding high compensation, not because they are any more brainy than many others around them, but for the reason that they have had that technical training which has fitted them for such positions.

It is believed by many that theory and practice are never compatible, but the Germans, probably the most progressive and practical nation of the world, have brought about some of their most wonderful results by working a theorist and a practical man side by side.

If Germany, with 51,000,000 inhabitants, with insufficient land to sustain her population by agricultural pursuits, importing her raw materials, and as much as 1,000,000 tons of coal per year, and quantities of food stuffs to sustain life in her people, be taken as an example of what industrial education can do for a nation, the advantages of such training to a country as rich in natural resources as the United States must be apparent to all. Yet Germany, laboring under these great disadvantages, stands second in the list of trade nations of the world.

About one-half the requests for sample aniline dyes to be used in experimental dyeing in the textile school at Clemson College were answered with the statement, "We have ordered the samples you requested from Germany." Germany has a magnificent system of industrial schools, and we have not; we have the natural resources, and Germany has not. This shows that a country which possesses or is in proximity to the raw materials will not necessarily reap the wealth that it might by manufacturing these raw products into salable articles, thereby increasing their value, in some cases, 10,000 times. But it does show that any industry will seek that nation which has the special knowledge best suited to it.

One of the principal reasons why the South has not increased in wealth like other sections of our country is that she has been the raw-material producer of the nation, while she has every natural advantage for the manufacture of her products. In recent years she has awakened to a wonderful degree in the development of her industries. It is not a spasmodic boom of effort, but a substantial movement toward the betterment of this section.

In order to continue this progressive movement, the South must have men of original ideas; men of scientific education. In the manufacture of cotton fabrics alone the South is in need of thousands of young men who have been specially trained for this work. They must be well posted not only in the care and operation of the machinery used, and in the processes of manufacture, but in many other details, according to the business and the position held therein. They must be competent to produce finer and more elaborate fabrics, and to originate designs as well as copy the designs of others. There are many capable young men employed in the mills who are anxious to learn the business, thus putting themselves in line of promotion to responsible positions, commanding high compensation. In the mill they are instructed in the practical operations of the machinery only, and do not receive that auxiliary technical training in the other details of manufacturing which is so necessary to their success as overseers, superintendents, and managers.

No textile school is so well equipped for practical instruction as the mill, and the best instructors to be had are the competent managers, whose whole time is taken up with the detailed management of such plants. But these mills are not operative for instruction purposes, neither have these managers the time to devote to the instruction of young men who may chance to come under their observation. And in many cases the young man in the mill has not had that previous technical foundation upon which to specialize in industry; therefore he would

probably be narrow in his education and lacking in originality of methods, and his taste for the æsthetic would be undeveloped. Thus the absolute necessity has arisen for the establishment of such schools as will give these persons that special training of which they stand in need.

In almost every town and city of this country we find various articles of manufacture stamped with the three significant words, "Made in Germany." The demand for articles bearing this trade-mark shows their superiority. These articles are always in demand, and considered by many to be of superior quality to other makes. Why is this so? Simply because they bear the trace of the letters which make up these words? No. It is because these words are backed up by the knowledge of years of training in special lines, and we know that they are the best that science and skill can produce.

Industry is based on science. The American people are, above all other people, scientific. To develop this scientific turn of mind, we must have industrial schools. To build a house, we begin at the foundation. To build up a man, we must begin with the child. These industrial schools teach not only the theoretical "why" a piece of work must be executed thus and so, but the practical "how" to execute it, as well. In other words, the mind and the hand are trained simultaneously.

Hon. J. C. Monaghan, United States consul at Chemnitz, Germany, in an address before the Manufacturing Club in Philadelphia, November 4, 1899, said: "A distinguished German educator, while speaking to an Englishman, smilingly remarked: 'In England your finest workshops are those in which you make your machines; these are the workshops in which we make our men.' 'But how are they paid for?' said the Englishman. The German shrugged his shoulders and replied, 'Look in your shop windows in England and you will see how they are paid for.'"

Wherever you find the trade-mark "Made in Germany" you find the people who are paying for Germany's fine system of industrial education. What Germany has done we can do, because our nation is equally energetic and our natural resources are much greater.

I know that your commission is as well posted on the German example of industrial training as I am, if not better, and as it is needless to be thrashing over old straw, the following will serve as an example of what one line of industrial training could do in this country. The additional revenues from this one industry alone would pay for the establishment of all the kinds of industrial training schools that this country would need a thousand times over.

Take the average cotton crop of America as 10,000,000 bales, and it costs, say, 5 cents per pound to produce it. If all the influences tending to reduce the cost of production could be brought to cooperate in such a way as to reduce the cost of production to 4 cents per pound, or a saving of 20 per cent, it would be a saving of only \$50,000,000.

On the other hand, if we produce a number of men and women sufficient to turn this vast crop of raw material into cloth, and take the average price of the cloth at three times the value of the raw material—and surely this is a conservative estimate—we should convert this 10,000,000 bales into fabrics at, say, 18 cents per pound, bringing into this country \$850,000,000 more than if the raw material be exported.

Our factories are now utilizing only about 30 per cent of our cotton crop; therefore, foreign countries are reaping the benefit of manufacturing nearly 70 per cent of our cotton. If new factories are to be built to manufacture this other 70 per cent of our cotton, they ought to be managed by our own youths, because managers unacquainted with the peculiarities characteristic of our Southern labor are not in position to reap the very best results of their labors. A training of our own people will put them in possession of the knowledge of how to increase the value of cotton three, five, or even ten fold. This result can not be brought about by textile education alone, but we need trained civil, electrical, and mechanical engineers, as well as textile engineers, and to make these men we need special schools for training them.

The foregoing example does not include the additional benefits of better highways, more railroads, development of mines, and manufacturing in other lines which would necessarily be brought about by having trained men in those different occupations. And besides all these, the benefits in other ways would be infinite. More common schools, more churches, more public libraries, and more everything that goes to make up life.

CLEMSON COLLEGE.

Clemson College stands preeminent among Southern institutions for thoroughness in her training. This is shown by the success of her graduates. Her graduates are now filling positions of importance in various lines of work. Many of

these young men came to Clemson College from the farms, and knew absolutely nothing in the lines in which they are now earning their living. Their success is due to their industrial training.

Owing to the Spanish-American war, a large portion of the class of 1898 secured positions in the United States Navy several months before they had completed their course of study. Several members of this class are now working with shipbuilders, railway companies, bridge constructors, and builders of electric machinery. A graduate of this class is now in charge of a large electric power plant in South Carolina.

One of the largest manufacturers of electric machinery has been working four of Clemson's graduates. Within the last week (January 31, 1900) this company has requested the college to send two other men to them. This would make six men from this institution in one company's employ, showing that they are giving entire satisfaction.

Within 6 weeks after graduation the entire class of 1899 had received profitable employment. A member of this class, within 3 weeks after graduation, stood a competitive examination and was given control of a Government electric plant, over the head of the man who placed the machinery in running position and who also tried the examination. The salary is \$1,200 a year.

These few examples stand as silent witnesses to the thoroughness of Clemson's work, and to the value of industrial training to the individual receiving it.

It will be remembered that a large majority of the students of Clemson are farmers' sons, and many of them have not had the advantages of a common-school education, so that the whole work of their development has been left to Clemson College.

Q. (By Mr. SMYTH.) You say you have now about 435 boys in the institution?—A. About that.

Q. All white?—A. All white; yes.

Q. Has South Carolina any college of this kind for colored boys?—A. There is one at Orangeburg. They have no textile department. They run practically a manual training school there.

Q. Will the Clemson College receive this year as many students as it can accommodate?—A. Yes; we had to turn away quite a number. The application list for next year is also about filled now.

Q. And the several departments which you have enumerated are pretty fairly divided?—A. Pretty fairly divided.

Q. If the college had a larger endowment or income, could it not largely increase its work?—A. It would be of great value; yes. They could increase the thoroughness of their work and the kind of work—a larger equipment.

Q. You think, then, if the nation could recognize a duty toward the maintenance of manual schools, aiding in the support of manual and textile schools, particularly in the four States of the South where we have a large population that is ignorant and have not the means or facilities for education, that appropriation could be very judiciously used?—A. Yes, sir.

Q. Would you favor multiplying the number of plants or enlarging, say, Clemson to a much greater extent? Would the advantages be greater by combining the institutions at one point for a larger number of boys and professors, having a better equipped laboratory, or is there a limit, and would it be better to divide up?—A. I think there should be one school in the State, what you might call an advanced textile school, and it would work to advantage to have several other schools in the State not so high in their training, so that once they get a good general knowledge of the business in these, you might say, primary schools, if they wish to carry the work on they can go to these higher schools.

Q. Do we understand the entire income is only about \$70,000 or \$75,000 a year?—A. Taking it on the average. I was giving the average income.

Q. That includes the amount received from South Carolina and the amount received from the General Government?—A. For the last year the income has been greater than that.

Q. (By Mr. RATCHFORD.) Added to that is the \$20 per student for the year's course?—A. The average cost, I stated, is \$20 less per student than the average agricultural and mechanical college.

Q. (By Mr. SMYTH.) What is the cost to the student?—A. They put it at \$99 a year, and that includes board, lights, fuel, and laundry, uniform, and cap. It does not include shoes nor underclothing nor books—that is, nontuition-paying students.

Q. How many classes have you? How are they divided?—A. I could not tell you that exactly. The students who are too poor to pay tuition are taken in on the certificate, I think, of the auditor of the county.

Q. (By Mr. RATCHFORD.) What is the regular tuition fee?—A. Forty dollars.

Q. That is added? Money collected in that way is added to the \$71,000?—A. Yes, sir.

Q. And is a part of the general income of the college?—A. Yes, sir.

Q. I want to ask you whether you are familiar with the practical side of manufacture?—A. I am; yes, sir.

Q. Under the general heading of industrial education you spoke of the age at which a youth should take up certain lines of education, industrial training, and that "up to 14 years of age no specializing of subjects should be allowed." Being familiar with the practical side of it, I want to ask you at what age, in your opinion, a youth should enter a manufacturing establishment to earn his own living?—A. I think at not less than 12 years old.

Q. You think 12 years is a proper limit, do you, under present conditions?—A. Under present conditions, I do.

Q. Entering the establishment at that age, he would be denied the advantages of this education?—A. Almost; yes. Under some conditions I think a good, energetic young fellow could apply himself at nights and afterwards do this work. That would give him the advantage of having 2 or 3 or 4 years of practical life in the mill before he takes up the theoretical side of the work.

Q. What influence or effect is found to exist from the employment of children in the factories of the South? I mean the influence on adult labor. Is it found to be an advantage or a disadvantage?—A. I do not know that I am prepared to answer that. It is a question I have thought on a good deal.

Q. (By Mr. SMYTH.) Is it not a fact that there is employment for everybody in the South to-day in the cotton-mill line?—A. Yes, sir.

Q. Do you think the employment of children from the age of 12 years up deprives any adult of employment?—A. It does not.

Q. It is not customary to use adults, is it, in the spinning room? The frames are designed for children?—A. Yes, sir. It is almost exclusively done by children.

Q. (By Mr. RATCHFORD.) Are you prepared to say, following that, whether or not it affects the wages of adult labor?—A. I am not. I think not.

Q. (By Mr. SMYTH.) The answer to that would be the same, would it not? As adult labor does not come into competition with child labor in the spinning room, it would not affect it?—A. It would not affect it.

Q. Has not the climate a good deal to do with the development of children? Under the Southern climate does not the child mature much sooner?—A. I think so.

Q. Children are much more developed physically than at the same age in northern climates?—A. Yes, sir; I think so.

Q. So there would, perhaps, be some difference between a child of 12 years in North Carolina and a child of 12 in Massachusetts?—A. Yes, sir; I think there would be.

Q. (By Mr. RATCHFORD.) Do you believe the difference is sufficiently great to make a difference in the age at which they should enter the factory?—A. I think it would make a difference; yes.

Q. What truth is there in this claim that competition, which is generally conceded, I believe, to be a great factor in the affairs of every manufacturing and business man, has to be met either from the North or from the South without regard to these climatic conditions we speak of; that is to say, the manufacturer in New England would have to place his products on the market and meet the prices that prevail in that market from every other section of our country?—A. What is the question? Do you mean what effect that would have on prices?

Q. The question I would like to hear you on is this: Is it not a fact that the differences of which we speak now are not in any way regarded by competition? Competition does not acknowledge any such differences?—A. In the ages?

Q. Yes.—A. I think not. I know it does not.

Q. (By Mr. SMYTH.) Do you not think the natural advantages of any one section ought to be recognized and admitted, whether the climate is advantageous or otherwise?—A. I think so.

Q. The nearness to coal fields, for instance, in Alabama gives industries located there an advantage over the same industry located at Charlotte?—A. It does.

Q. Because it saves the railroad freight on coal, which is sometimes three times the cost of the coal itself. Therefore it would not be fair to rob Alabama of the advantages she has in her coal, would it?—A. It would not.

Testimony closed.

these young men came to Clemson College from the farms, and knew absolutely nothing in the lines in which they are now earning their living. Their success is due to their industrial training.

Owing to the Spanish-American war, a large portion of the class of 1898 secured positions in the United States Navy several months before they had completed their course of study. Several members of this class are now working with shipbuilders, railway companies, bridge constructors, and builders of electric machinery. A graduate of this class is now in charge of a large electric power plant in South Carolina.

One of the largest manufacturers of electric machinery has been working four of Clemson's graduates. Within the last week (January 31, 1900) this company has requested the college to send two other men to them. This would make six men from this institution in one company's employ, showing that they are giving entire satisfaction.

Within 6 weeks after graduation the entire class of 1899 had received profitable employment. A member of this class, within 3 weeks after graduation, stood a competitive examination and was given control of a Government electric plant, over the head of the man who placed the machinery in running position and who also tried the examination. The salary is \$1,200 a year.

These few examples stand as silent witnesses to the thoroughness of Clemson's work, and to the value of industrial training to the individual receiving it.

It will be remembered that a large majority of the students of Clemson are farmers' sons, and many of them have not had the advantages of a common-school education, so that the whole work of their development has been left to Clemson College.

Q. (By Mr. SMYTH.) You say you have now about 435 boys in the institution?—A. About that.

Q. All white?—A. All white; yes.

Q. Has South Carolina any college of this kind for colored boys?—A. There is one at Orangeburg. They have no textile department. They run practically a manual training school there.

Q. Will the Clemson College receive this year as many students as it can accommodate?—A. Yes; we had to turn away quite a number. The application list for next year is also about filled now.

Q. And the several departments which you have enumerated are pretty fairly divided?—A. Pretty fairly divided.

Q. If the college had a larger endowment or income, could it not largely increase its work?—A. It would be of great value; yes. They could increase the thoroughness of their work and the kind of work—a larger equipment.

Q. You think, then, if the nation could recognize a duty toward the maintenance of manual schools, aiding in the support of manual and textile schools, particularly in the four States of the South where we have a large population that is ignorant and have not the means or facilities for education, that appropriation could be very judiciously used?—A. Yes, sir.

Q. Would you favor multiplying the number of plants or enlarging, say, Clemson to a much greater extent? Would the advantages be greater by combining the institutions at one point for a larger number of boys and professors, having a better equipped laboratory, or is there a limit, and would it be better to divide up?—A. I think there should be one school in the State, what you might call an advanced textile school, and it would work to advantage to have several other schools in the State not so high in their training, so that once they get a good general knowledge of the business in these, you might say, primary schools, if they wish to carry the work on they can go to these higher schools.

Q. Do we understand the entire income is only about \$70,000 or \$75,000 a year?—A. Taking it on the average. I was giving the average income.

Q. That includes the amount received from South Carolina and the amount received from the General Government?—A. For the last year the income has been greater than that.

Q. (By Mr. RATCHFORD.) Added to that is the \$20 per student for the year's course?—A. The average cost, I stated, is \$20 less per student than the average agricultural and mechanical college.

Q. (By Mr. SMYTH.) What is the cost to the student?—A. They put it at \$99 a year, and that includes board, lights, fuel, and laundry, uniform, and cap. It does not include shoes nor underclothing nor books—that is, nontuition-paying students.

Q. How many classes have you? How are they divided?—A. I could not tell you that exactly. The students who are too poor to pay tuition are taken in on the certificate, I think, of the auditor of the county.

Q. (By Mr. RATCHFORD.) What is the regular tuition fee?—A. Forty dollars.

We have, in the establishment of Clemson College, held on to one idea inexorably; that is, that it is not a manual school. We are not teaching boys how to be mechanics or machinists, but we are trying to educate their minds, broaden their intellects, and teach them all the fundamental principles, together with the practice, in all the different departments of work. When they get through they have such an experience and knowledge of these matters that any man with the knowledge that we furnish to him can make a man of himself in any department of life. That is the end and object.

Q. You have always had at Clemson a foundry and machine shop?—A. Oh, yes. We have a wood shop, blacksmith shop, foundry, machine shop, electrical and mechanical laboratories, designers, free-hand instructors, and physics; all these in the mechanical department. We have a professor of agriculture, and under him there are the instructors in horticulture, botany, veterinary science, etymology, and 2 or 3 others which I can not call right at this moment. They are taught not only the theory, but also the practice, and in connection with that department is the experiment station. Of course the appropriation made for the experiment station is entirely separate and outside of the college—not used in any way for it, but for the purpose of conducting experiments. But these experiments are made and conducted under the eyes and observation of the students in agriculture, and in that way the results are most beneficial in a way that could not be attained by the mere reading of the bulletin.

Then we have another department. We denominate it the chemical and scientific department. That embraces chemistry, geology, mineralogy. We have instructors in all the subdivisions there. Then we have the textile department, of which Mr. Beatty has been telling you.

The school is wonderfully successful so far; far beyond the expectations of the most sanguine advocates of it. We have turned away this year as many as we were able to take in, and we have received enough written applications for admission in September to fill the college anew.

We estimate the results by the fact that the boys, when they graduate there, step right into good positions. The graduates are in great demand, and that is one thing that has given such an impetus to the demands upon that institution.

I asked the president a few days ago to make a statement before a legislative committee, and he made the statement (which I think is correct, from my best observation) that they step right from the college into salaries from \$600 to as high as \$1,500. We have some young men who are getting salaries larger than their instructors receive from the college. There is a great demand for them, and we can not supply them.

Q. Where is this college located?—A. It is located at Fort Hill, Oconee County, S. C.

Q. How many students can you handle?—A. We can not handle over 450. It is rather crowded, too.

Q. That was the home place of John C. Calhoun?—A. Yes.

Q. On the Air Line Railroad, between here and Atlanta?—A. Yes, sir; and that place was donated by his daughter to the State for the purpose of establishing this college.

Q. (By Mr. RATCHFORD.) Have you any plan to recommend to the commission by which the general usefulness of that institution can be increased?—A. I have often thought that there was one way; in fact, I have suggested it to several members of Congress, that they could do an incalculable benefit to the country. One of the difficulties—the greatest difficulty we had to contend with in the establishment of that college—was to educate the people up to its importance and necessity. They had never seen anything like it before, and many of these schools that had been established had proved failures, and perhaps it is one of the most difficult matters that anybody has ever undertaken, to establish a literary and technical college combined in one, and to combine the courses of study belonging to each. It is a very costly institution, and this textile department that we have recently added to the college, I am afraid unless we get some assistance it is going to swamp the whole college enterprise.

Q. (By Mr. SMYTH.) What is the plan you have suggested to your Congressmen?—A. As it has been explained to me, the Federal Government made an appropriation of \$15,000, known as the Hatch fund, for experiment stations. As I say, it has been explained to me that these stations proved to be in a large measure failures, from the very fact that the bulletins sent out were along scientific lines alone. You see the average farmer took no interest in them and would not read them understandingly. Hence the appropriation to the States of \$25,000 each known as the Morrill act to supplement that Hatch fund, or, in other words, to render it available, for that \$25,000 can be expended for purposes of education.

In other words, to-day, as I have said, we are doing these experiments and letting them be carried on under the eyes of the students, who can see and understand not only the practical results, but the scientific objects sought to be accomplished. Now, that fund—the Morrill fund, as it is called—supplements and enables us to do it. Unless we can get some additional assistance the college will grow, I am afraid, beyond the estimate of the people of the State of their ability to support it.

Q. Tell us something about the educational work in South Carolina. What does the State appropriate? What is the tax of the public schools?—A. I have not figured it out myself. I can only state it from information we receive. The State appropriates for public schools about \$1,000,000 a year.

Q. That is divided per capita, is it not, between the white and black children of the State?—A. Yes, sir; it goes to the two races.

Q. The colored children get as much as the white children in proportion to number?—A. Yes; and being largely in excess, they get the bigger part of it.

Q. Do you know to what extent these schools are kept open during the year? Do you know how far that million dollars will go?—A. Not on an average, I think, over 3 or 4 months.

Q. The State is exceedingly poor, is it not?—A. Exceedingly poor; yes, sir; and in addition to that almost every community of any importance has a graded school and an additional taxation upon itself. These graded schools are organized, and a special tax is levied in addition to the tax provided by the State.

Q. Is it not a fact, in the Southern States, taking South Carolina only as a type, that there is a larger mass of ignorance in proportion to the population than in any other portion of the United States?—A. Of course when the negroes were freed they stepped out of almost abject ignorance and at once became citizens, with all the privileges of citizenship, and it was very soon discovered that in South Carolina, speaking for South Carolina, that the very large excess of negroes over whites seriously endangered the existence of the white race unless something was done to save the race from being overwhelmed, and it was very generally considered (and the State has acted upon it) that the best course to pursue was to educate the negroes.

Q. (By Mr. RATCHFORD.) In arriving at these conclusions as to illiteracy you embrace both races?—A. Both races; but the excess of ignorance was far greater in the negro race than in the white, because the white people had free public schools to a certain extent—not to the extent that we have them now, but in the State before the war the white race, even among the very poor people, had some smattering of education.

Q. (By Mr. SMYTH.) Did you have free public schools before the war?—A. Yes, sir; and the State has been very liberal, exceedingly liberal, in its efforts to educate the negro, and it has been a terrible tax upon us. It is that tax that has kept down and prevented the organization and establishment of these higher or technical institutions. It was one of the arguments that was used by many people in the State to oppose the establishment of Clemson College.

Q. (By Mr. RATCHFORD.) Have you had any colored students in the college?—A. No, sir; the State has provided another college similar to that for the negro. The president of that college is here, and he can speak for himself. You remember Congress gave to the States back yonder land scrip?

Q. (By Mr. SMYTH.) Yes.—A. Our fund was during the war—I mean during reconstruction—stolen and the State replaced it—issued bonds, which are still outstanding, that raise an amount which is equally divided between this colored school and the Clemson College. Then the Morrill fund is equally divided. The only fund that is not divided equally is the Hatch fund. The authorities that manage and control this are utterly opposed to the establishment of branch institutions. It is hardly enough to conduct one profitably, and they will not allow us to establish a branch, where, in certain portions of the State, conditions are different. We have tried it, but not a dollar of that helps Clemson College.

Q. (By Mr. RATCHFORD.) Has your State ever been asked for an appropriation to aid in this educational work?—A. Which; the colored?

Q. No; to your Clemson College?—A. O. yes; the State has given us the money to build all the buildings and equip them—some \$300,000 or \$400,000.

Q. Has the State from time to time appropriated anything for its maintenance?—A. Well, yes, sir.

Q. (By Mr. SMYTH.) You get the proceeds of that tax?—A. We get the surplus proceeds of the privilege tax—tax on fertilizers.

Q. (By Mr. RATCHFORD.) Any special appropriation outside of that?—A. No.

Q. (By Mr. SMYTH.) That amounts to about \$50,000?—A. Yes, sir; sometimes not that. We have all that work to do, and manage to conduct it very cheaply and economically, in order to save from it as much as possible to run the schools—the inspection, tagging, examination, analysis, publishing bulletins, and so on.

Q. (By Mr. RATCHFORD.) Have you any particular plan thought out by which additional funds might be raised for that institution?—A. Not through our State.

Q. Not through your State?—A. No, sir; the State has established an industrial school for women, has spent a good deal of money in building houses and school-rooms and equipping them, and it makes an appropriation for that. The State also has two other literary schools—the old-time South Carolina College and the Citadel Academy, which is not an ordinary literary school; it is located at Charleston. Both of these institutions are also maintained by the State.

Q. Your proposed plan of assistance, then, would come through the Federal Government, would it?—A. Yes, sir. We have to be very careful in asking appropriations from the State, because if they should give one a little too much it would be taken from the other institutions. There is a very good feeling between these institutions, and they do not do that. Whatever help we get must come through some other source, either private donation or the Federal Government. We want a great deal more money for Clemson College to conduct it properly, to meet the demands—a great deal more money than the State is able to pay. In fact, we ought to double its capacity; and, as I remarked, this textile department is going to be so costly that unless the State rises to a comprehension and conception of the importance of these schools (I speak of the different departments each as a school) I have very grave doubts of the willingness or ability of the State to meet the necessities of the college.

Q. (By Mr. SMYTH.) Then your plea for Federal assistance would be that South Carolina is a poor State and was very heavily impoverished by the civil war?—A. Yes, sir; it was desperately impoverished.

Q. And left with a large mass of ignorance?—A. Yes—to educate; and they have for the last 30 years past been doing their duty manfully. The negroes take to education more readily than the white people, and it came to be a very serious matter at one time to stir the white people up. I know of no obstacle that has ever been put in the way of the negroes' education. The State has been extremely generous, magnanimous, toward the education of the negro, and it has spent a great deal of its means and ability. When I look back and recall the impoverished condition of the State, the individual citizens of the State, the great bulk of them, of every class and condition, and think how poor we were, and then remember how we have met the responsibilities that were cast upon us by the change of conditions and overturning of everything, I am surprised at the results. They have labored industriously and have been generous and magnanimous in trying to lift up the people, not by means known before the war, but by methods that have become manifest and necessary since that condition brought about by this change.

Q. You think, then, that the attention of Congress should be called to the necessity of aiding these impoverished States that have the problem to meet of a large population of uneducated, both white and colored?—A. Yes, sir. I regard the manual and textile education as the greatest necessity for the Southern people of anything you can mention.

Q. (By Mr. RATCHFORD.) Do you think the South is peculiarly adapted for that sort of education?—A. We peculiarly need it, because we have never had anything of the kind.

Q. Is it a fact that a larger field is afforded for the resources of your Southern country through such an education?—A. Yes, sir; we have millions of resources along the line of manufacturing, where heretofore there has been nothing in the South at all. The opportunities for the development of these resources are untold. We had hardly a man in all the South who could be of any benefit to anybody.

Q. What have you to say with reference to the public-school system?—A. Well, sir, it is one of those things that we have long ago ceased to discuss as a good or bad thing. It is a thing fixed and irrevocable. It is working out good results as we go along and improve it.

Q. As it is to-day, is it adapted to the needs of the people?—A. It is not sufficient. We have not money enough. Notwithstanding the State gives \$1,000,000, it does not run the schools more than 3 or 4 months in the year, and that, you know, is not sufficient to meet the wants of the young people.

Q. (By Mr. SMYTH.) Is it your experience that the larger per cent of the population in South Carolina under 21 years of age is uneducated to-day?—A. Yes.

Q. Unable to read and write, a large percentage?—A. There is quite a large percentage, yes, sir, unable to read and write.

Q. They have not really then the opportunity of going to school?—A. No, sir; and they have got no conception of it at all.

GENERAL AND INDUSTRIAL EDUCATION.

Q. (By Mr. RATCHFORD.) Is it your opinion that an amendment to your public-school system, lengthening the terms from 3 to 6 or 8 or 9 or 10 months in the year would bring about better results, and, perhaps, in a shorter time than giving a technical education to the smaller number?—A. I do not think that would do at all, as you state it.

Q. You think they are both necessary to the well-being of the people?—A. Yes, sir. I have no confidence in and no regard whatever for this thing which we call educating a child, giving him a little smattering of learning, teaching him to read and write. I do not call that education; it is a beginning, a start; but unless it is carried further and developed, I can not see that it is of any benefit at all. I would say emphatically that it is of no benefit. You give a child that preliminary education, a common-school education, and if it has not suggested enough to the mind of the child to cause him to want more and to go further, and he stops there, he is not benefited by what little he has received. What we need in the State, in my judgment, to meet the necessities there, is high schools—a link between the colleges and the common schools. You go out through the country (in the towns and villages they have these graded schools), but the boys in the country, the sons of the farmers—and some of the brightest boys that we have are out in the country—they have no facilities but the common school, and hence they can not step from there into the college.

Q. Do you think the State is doing all in its power to give the opportunity for a common-school education to all of these children?—A. Yes, sir; everything, and more than it is really able to give. The little of that which they appropriate for higher education is a bagatelle, and if you take every dollar appropriated for the higher education and devote it to the public schools, it would not extend the term a week, or more than two weeks at the outside.

Q. Have you a system of private schools in your State?—A. No, sir; none at all that I know of. I believe there is one in Charleston. I believe that is kept up by private donation.

Q. How long, in your opinion, should the school term continue each year to do justice to the pupil?—A. It ought to continue at least 8 or 9 months; between 8 and 10 months would be all that would be necessary.

Q. At 3 months' schooling in the year, how much will a child be benefited by the education that it receives until the age of 13 or 14 years, when it enters the workshop?—A. We do not allow them to enter the workshop at 13 or 14. You mean the higher schools?

Q. No; I mean the ordinary workshop in which they are to earn their livelihood.—A. Well, sir, I have no knowledge or experience on that point.

Q. Your opinion is solicited on that point. A child going to school from the time it reaches a school age until the age of 12 or 14 years, only 3 months each year, it certainly can not profit much by the education it receives?—A. No, sir; as I stated before, I have no respect for that kind of an education, and do not regard it as education. It is a little learning.

Q. Yet you feel that a common-school education for 8 or 9 or 10 months in the year is very desirable and would benefit the people of your country?—A. That appears to be not only my opinion, but the universal demand, the point we are trying to reach and hope to accomplish.

Q. I want you to differentiate between the system you have and your purpose.—A. Our system does not extend far enough, long enough, and then we have not got the money to establish the high schools to enable the bright boys, who want to go farther and seek a proper education, to step from these common schools into the schools which the State has provided for them.

Q. Has there been any tax system proposed by your State with a view to lengthening the terms of the schools?—A. Yes, sir; I have stated that. In most of the towns and in some of the country district they have, under a general law allowing them to do it, levied special taxes.

Q. What part of the general tax of your State goes to the school fund?—A. I can give it to you approximately. Taking all the expenditures, all the taxes in the State for all purposes, more than half of it goes to the public schools.

Q. (By Mr. SMYTH.) Three-fourths?—A. I wanted to be on the safe side; I know more than half.

Q. (By Mr. RATCHFORD.) What is the system of taxing corporations, railroad corporations: are you familiar with it?—A. Somewhat. The railroads are taxed by a commission. They are not taxed by the local assessors, the tax assessors in the county who tax other property. There is a State board for the purpose of taxing and equalizing all the taxes on all the railroads in the State.

Q. Is the amount of taxes paid equal to the amount paid in other States?—A. I can not answer that. I have no information. I have heard of no dissatisfaction

about the amount of taxes that they pay, that is, among our people. In fact, I rather think they are a little severe on them, more than on other property.

Q. You believe that for the State to levy taxes upon any of its industries for the purpose of improving the school facilities is impracticable at this time?—A. It is carried to the full capacity of the State, and if you will allow me to suggest as an idea—I have suggested it to several of our members of Congress, that they ask Congress for an appropriation to aid this Morrill fund. That is where we principally need help in this State, especially since we have got into this textile industry. It would be a very valuable thing, indeed, if Congress would help us along that line.

Q. (By Mr. SMYTH.) You spoke of the colored children showing a greater eagerness for schooling than the white at one time?—A. Yes, sir; they do it yet.

Q. I asked if there was not a very large percentage of your population to-day which was densely ignorant?—A. Yes, sir.

Q. Is there not a very large percentage of the adult whites in your State, particularly in the poorer portions of the State, that are ignorant?—A. A very large per cent, did you say?

Q. Of the adults of the mountain country, and all along through there?—A. In the sense of not having book learning there are a great many of them. A great many of them are of that sort, and a heap of them have learned to write their names. They do it mechanically, and do not know anything about it.

Q. Is not the fact that the white children do not attend the public schools, even for the 3 months, due largely to the fact that the parents do not favor it?—A. That is the trouble—the dense ignorance of the parents. They feel such an absolute disgust for education that they will not let their children attend, even when the school is at the door. That is the big difficulty that we have got to fight with in our State.

Q. Ought you not to have a compulsory school law?—A. I am not prepared to advocate that. In our State we have not got schools located where they would be convenient to a great many children in the country. It would be a terrible hardship to require them to go to school unless you had districts divided up so that the schools would be convenient. Then we have not got the system brought down to anything like enough perfection to undertake to resort to that method. I believe there is another method by which we can accomplish the same results as by the compulsory law. I remember saying once to a gentleman who was opposing Clemson College: "We are trying to establish an institution here that will appeal to the wants and necessities of the people, while you advocate the old system, advocating at the same time compulsory education. Now, I believe the compulsory education system will have to go along with the old educational system; but if we were to adopt our system of education and meet the wants and demands of the people, and let them see it demonstrated, they would all seek it." I know by my own observation and experience here with Clemson College that three-fourths of the boys there are the poor boys of the country, that never would have got an education anywhere else in the world, and many of them are working their way through there. If we had the means to help the poor boys we could double the capacity and fill the college full with boys from that ignorant class of people. There are lots of boys at Clemson whose fathers have no more knowledge of education than—I might say, I have [laughter]; not a bit; and yet they have sent their sons and are keeping them there.

Q. (By Mr. RATCHFORD.) Do I understand you to say you have no schools in some sections of the State near the home of the pupils, and that is a reason—A. (Interrupting.) I said that was a reason for passing—it would be hard to explain these country conditions unless you have lived in them. You go and establish a school at a well-known place and it will run there perhaps for a few years, and all of a sudden it will begin to die down and go out, and you will notice that the children in that neighborhood have grown up and gone off and gone into business, and maybe right at that time the next crop of children are not there. Maybe that school will stay there, just barely hanging on, for a dozen or a half dozen years—I knew one that remained in that condition for a dozen years—and then another crop of children will come on. These conditions induce the people in the country to make a good many changes in the schools, and it has not got down to a fixed, regular system of division. Then again there are big streams which the children can not cross, and high waters, and so on. Many efforts have been made to overcome these difficulties, and they are still seeking to overcome them. They will be overcome in the end; but I say that our system has not got to such a state of perfection that I would advocate compulsory education.

Q. Could not the law be framed so as to apply to the towns and not apply to the rural districts?—A. Oh, yes; I do not know whether such a law as that would be constitutional. It would be a special law.

Q. For instance, to apply in all cases where children have not got more than a certain distance to travel to the school? Have you any noticeable class of shiftless persons in the population that abandon communities?—A. There is an element of that kind to be met with in the white race almost in every locality; but did you use the word "abandon?"

Q. Yes; I used the word, "abandon" communities, for instance, and settle somewhere else?—A. We have a very large element of shiftless negroes, that do not abandon us, unfortunately. They hang around our villages and depots and apparently do nothing, as far as we can see; a great many of them do not care to have any mode of livelihood.

Q. I can understand how that is, where a manufacturer, for instance, changes from one place to another. A mill might be abandoned at a certain place and be rebuilt at another, of course carrying with it the operators. But your State is principally an agricultural State?—A. No, sir; the upper part of the State is getting to be one of the largest manufacturing settlements in the South.

Q. Is there any shiftlessness along there?—A. No, sir; there is no shiftlessness there among the white people.

Q. It is among the agricultural class, is it?—A. I can not say that there is, unless I understand what you mean by shiftlessness—you mean unsuccessfulness? If you mean that, there is a very large class of unsuccessful men in the agricultural business. They do not work very hard, but they still work and attend to their business and get along as peaceable, good citizens.

Q. Because of their lack of success they are likely to change from one place to another, are they—move around?—A. No, sir; not very much. I am speaking of my own knowledge now. There is not much moving among them.

Q. The illustration that you gave as to schooling a few moments ago led me to ask these questions. A school being built in a certain community and scholars who want to attend it having grown up and left the school, the school stands until another crop of children have grown up to occupy it again?—A. I do not mean by that that the parents move away.

Q. (By Mr. SMYTH.) You mean in sparsely settled communities?—A. I was trying to explain this country, where very frequently even the membership of the country churches will go down to the very lowest ebb, because all the old members have died out, but some of them have moved out or changed their membership; and the schools are the same way. The crops of children come in shoals, like fish; that is my observation.

MR. RATCHFORD. They do? That explains it.

THE WITNESS. Sometimes the schools flourish because there are plenty of children, and then again the schools are not flourishing, because the children are scarce. Then they begin to work around and change the schoolhouse place immediately.

Q. (By Mr. SMYTH.) That applies, of course, to the rural districts?—A. Yes. If we could receive assistance in supplying all the demands of all the people in technical education, I believe that there would be such a demand for the necessary steps to reach that point that we should be supplied one way or other. There is a big movement on foot throughout the State to establish this technical teaching in connection with the free schools, and there are some schools that have been already organized. I think there is one in Charleston that has got the mechanical features. I do not know the nature of it; I have seen it in the papers. There is one down at Beach Island, and I saw several more in the State; and now Dr. Curry, head of the Peabody, made a speech in Columbia, before the legislature, in which he very strongly advocated the addition of technical training to the public-school system; and this demand is apparently growing. If children were trained in that system they could enter much more profitably or be prepared for what they wanted to take up. In other words, there is so much time spent at the college in learning these preliminaries. That holds back and delays education. That time could be improved much more profitably and they could be carried further in 4 years, a great deal, if they started in without that preliminary training. We are so anxious to meet the demands of these institutes that we should like help from any source. I would unhesitatingly—

Q. (Interrupting.) You think you can ask help from the United States Government with very good grace?—A. I would accept it with the greatest pleasure imaginable. I should like to say a word or two on this textile school. Of course that is a new business in this country, with one or two exceptions up North, and these were so costly that it was entirely beyond our power to establish anything duplicating those institutions. We had to start this upon a small scale. We wish that to be understood. The textile school addition to Clemson College has been made possible by the generosity of manufacturers all over the country in

donating to us the machinery outfit, the equipment. If it had not been for that generosity we could not have started it at all. This technical raining is very costly, in that it requires trained men, and these men are very scarce. You take a man in textile designing and weaving—I can not go into an explanation of this matter because I have no personal knowledge of it. I know they are very hard to find—very hard to find a man to fill the place that Mr. Beatty fills. We do not propose just to teach the boys how to spin and weave alone. If we did not intend to go beyond that, we could not with any kind of face ask the State to contribute a dollar for that kind of education; but I think that in States with this republican form of government of ours, it is not possible to tax the many for the benefit of the few. We can not tax the people to give a man a particular benefit. You can tax the people for the benefit of the whole, and incidentally an individual may be benefited. If we were to stop in that textile school with the idea of simply making weavers and spinners of them, that would be wrong, I think. If you were to go to the mill you could get that practical knowledge quicker. We carry along with it the idea that in textile training there is at least one-half and more that is mechanical. We have got machine shops and a mechanical department that they go through, and then they branch off into this textile training, and with all there is carried along with it a general broad education, a liberal education. When we take it into view that we are turning out educated men who are to go into our factories and become the leaders, and form the characters of the people in factory labor—broad, educated men—we think the benefits derived from such associations and influences as that would be large enough to justify the State in going into it. It is a benefit to the whole State, in preserving the State, preserving society, against uprisings and troubles that are liable to come in these large factory populations. By putting educated men in the mixture of labor to exert their influence over that mass, the benefit would certainly be enough to justify the State in levying a tax for the support of an institution that would bring about such protection to the people at large as that would be.

(Testimony closed.)

CHARLOTTE, N. C., March 11, 1900.

TESTIMONY OF MR. JOHN R. HARRISON,

Farmer, Fairview, S. C.

The subcommission of the United States Industrial Commission met at the Southern Manufacturers' Club at 10.40 a. m., Mr. E. A. Smyth presiding. Mr. John R. Harrison was introduced as a witness at 12.40 p. m., and, being duly sworn, testified as follows:

Q. (By Mr. SMYTH.) Will you give your name to the stenographer?—A. John R. Harrison.

Q. What is your residence?—A. Fairview, S. C.

Q. And your occupation?—A. I am a farmer.

Q. Have you any statement to make to the commission?—A. I did not expect to have anything to say upon any of the subjects except that of agriculture; but since I have come in here I have concluded to say something upon educational matters, and especially upon the free common schools of our State of South Carolina.

Q. We should be very glad to hear you on that, and also in reference to the labor conditions of the farming class of South Carolina, both white and colored, and any other topics that you would like to talk about.—A. To take up the free-school system of our State, first, we have a 3-mill tax levied upon all property of South Carolina for the common schools. It can not be devoted to any other purpose. In addition to that, all poll tax goes to the common schools.

Q. That is in the constitution, is it?—A. That is a constitutional tax. In addition to that, every school district of South Carolina has the privilege of levying an additional tax for educational purposes within its bounds. If a township is too large, by application of its citizens to the county educational board it can be divided up, and in nearly every instance that comes under my observation they have it divided up now so that in almost every instance we have one white and one colored school in a school district. For instance, there are half a dozen in a township, perhaps, and each school has a board of trustees appointed by the educational board of the county. The tax is the amount of money that comes

from the State of South Carolina to these free schools, and we have the option, as I said awhile ago, of levying a higher tax. Nearly every town in the State avails itself of that privilege. One right there by me is levying a 4-mill tax, making the educational tax 7 mills for the purpose of running the schools. That takes us up to the higher education of the State. We appropriate in round numbers in South Carolina \$200,000. That is my recollection of the last appropriation. That takes \$200,000 for the difficult higher education. That, however, does not include the tag tax, as we know, of fertilizers, which goes direct to Clemson College, and which amounts, as has been stated, in round numbers, to about \$50,000. So you see we appropriate a good deal of money to the common schools as well as to the higher schools. In regard to the tenants and the children of the different communities: I do not think that I can exactly agree with the gentleman, Colonel Simpson, who just preceded me. My observation is that our people, with very small exceptions, avail themselves of all educational opportunities that are presented to them. There are very few that will not send their children to school. There are a few that can not, but this class is very small. Sometimes you find a widow, who is left without anything and she must live in some way, and sometimes does it by putting her children to work. That class sometimes can not avail themselves even of the advantages of the free school. But a great many of them do it in this way: They will perhaps have half a dozen children, and they will send 3 or 4 of them to school this year, and next year those will go to work and another set will go to school. I am not claiming that our free-school system is anything like what we would like to have it. We should like to have it run 8 or 9 months. That is the general feeling throughout the State. My observation is that we have an abundance of what we call the higher literary education, but we have not an abundance of technical, manual, or industrial education. We are lacking in two particulars in regard to our educational system. My idea is that our common free schools ought to be graded up to the point where every young man and young woman should have an ordinary English education which would fit him for the transaction of the ordinary business of life, and after that time they should have the privilege of going to a technical, manual, or literary institution, as their inclinations would suggest. That is where the trouble has come in. I very heartily agree with Professor Beatty in what he said in regard to training by theory as well as practice. I know of a good many young men who have learned by actual practice—that is, manufacturing in its different departments—but they are lacking in that broader culture that the technical schools would give. I am not in any way connected with Clemson College, either as trustee or otherwise. I am not altogether in sympathy with the policy that is pursued there. I think that too much attention has been given in the past to the literary department instead of the technical. Since the establishment of this technical school recently (I believe it has been done within the last 2 years) more attention has been given to that department; but before that time some dissatisfaction existed in our State because of the fact that too much attention was given to the literary to the neglect of the practical and mechanical departments. I think the United States Government could very profitably give a liberal support to that institution. I do not take the view that a school like Clemson is beneficial to South or North Carolina, or to the South, even. I take the view that all products that are made in America, I care not whether in Dakota or South Carolina, should go out in a manufactured state. Therefore, if these technical schools are made a success, they will benefit the entire land. It would pay the United States, not only in the South but everywhere, to put money enough into that institution, with proper safeguards, to make it a first-class institution, and an institution at which every boy, whether he is rich or poor, can get the education that he wants. I think that South Carolina is appropriating just about as much money as she can afford toward education. Take, for instance, railroad property. It is assessed so many thousand dollars per mile. It is a fair valuation. It is not understood to be quite the amount that the property is actually worth, but very near it; and the levy for all purposes is about as much as the property can stand. Therefore we are not in a position as a State to do any more for education than what we have been doing; yet our common schools need it more than anything else. In addition to that, I would say that in the rural communities, where the education is most neglected, the neglect is not caused by the lack of appreciation of the need of it, but by the depression in that particular line which has existed in the South for a good many years. The raw material that we produce in the South has barely been above the cost of production, and it has reduced our people to very great straits, and my observation is that that is the cause of the migration Colonel Simpson spoke of. It is not an increase spasmodically of all children, but it is the depression of the business. Some

other business offers better inducements. That is all I mean to say on the educational question.

Q. The property in South Carolina is largely owned by the whites, is it not?—A. Yes.

Q. The taxes are largely paid by the white race?—A. Yes. The bulk of the taxes are paid by the white race. The colored race pays the poll tax.

Q. Could you give us any idea as to the amount of tax paid in South Carolina by the whites and the amount paid by the colored people?—A. My recollection of it is somewhere about three-fourths.

Q. The amount appropriated by the school is divided per capita, is it not, among the children?—A. Yes.

Q. That is, the colored schools get as much total as the white schools get?—A. Yes; the enrolled attendance of 1899 will be the basis for the appropriation of money for 1900. For instance, you have got a hundred scholars in your school enrolled for 1899. Then in 1900 your proportionate share of money will be based on 100.

Q. (By Mr. RATCHFORD.) Did I understand you to state that three-fourths of the taxes of South Carolina are paid by the white population, or thereabouts?—A. Since I answered that question I am satisfied I am mistaken, and I will simply say that a large per cent of the tax is paid by the white people. I can not say what per cent.

Q. You can not say whether the major portion is paid by the whites or not?—A. Oh, yes; very largely.

Q. (By Mr. SMYTH.) You are in doubt whether it is as low as three-quarters?—A. No, no. Now, since I answered that question, I may state that that is incorrect, that there is a greater difference than that.

A. Larger amount is paid by the whites?—A. Yes.

Q. The amount is divided among the pupils, regardless of the color. But there are more colored children enrolled in the schools of South Carolina than white?—A. Yes.

Q. Are there more colored people in the State than white people?—A. Yes.

Q. (By Mr. RATCHFORD.) What is the proportion of the colored population of the South to the whites?—A. It is between a third and a half.

Q. (By Mr. SMYTH.) It is four to six, is it not?—A. Yes; taking the entire population of the South. Our school system is a very good one. We simply are deficient for the lack of money to carry it along, that is all.

Q. (By Mr. RATCHFORD.) Have you any plan to suggest by which additional revenue might be raised by the State for that purpose?—A. Not by the State—I have not.

Q. By any other source?—A. I think it would pay the Government of the United States to make a liberal appropriation to the common schools and to the industrial and technical schools of the State. I would suggest an appropriation to the higher education of the State by the National Government.

Q. Do you know of any reason why North Carolina should not be benefited in the same way?—A. I do not.

Q. Or any other Southern State—Georgia, Alabama?—A. I even think there would be more benefit, or as much, at least, because I am not sure but Georgia's illiteracy is greater than ours. There is another point I intend to speak about, and that is there is only one place in South Carolina where a boy can get a free education; that is the Citadel Academy. It is supported by the State; he is boarded and clothed, and there is no tuition charged.

Q. (By Mr. SMYTH.) What is the Citadel Academy?—A. It is a military institution in Charleston. It is rather in the way of a business education with a military feature.

Q. Is it a State institution?—A. It is a State institution.

Q. Part of the students are beneficiaries of the State and part of them are paying?—A. The State appropriates money enough to support about two beneficiary scholars from each county in the State.

Q. (By Mr. RATCHFORD.) Have you any system of private schools in your State?—A. Yes. They are subject, though, to the public schools. For instance, we have schools that will run out in 4 months, 5 months, or 6 months. The patrons of the school will conclude that they want it to go longer, and they will call a meeting and make arrangements just simply to continue the school. That is frequently done, and especially is it the case at seasons of the year when the children are not needed at other business.

Q. In that case the patrons of the school raise the necessary amount of money to continue it?—A. Yes.

Q. Have you any parochial schools in your State conducted by the different religious sects?—A. Not of the primary order.

Q. For higher education?—A. Yes. We have almost every denomination. Four or five denominations have higher schools. We have more for women than we have for men, although I believe all denominations—Baptist, Methodist, Presbyterian, and Lutherans—have higher educational institutions. They have what they call the higher preparatory school at each of them. That is, when a boy goes to a college and is not prepared to enter he is placed in the preparatory department. I think we are as well equipped, so far as literary institutions are concerned, as we need to be, but we are deficient in common schools, and I think in the industrial and manual-training schools. I do not think that it would be good policy to inaugurate a system of technical training in the common schools of the State because of the fact that up to that point they are not very extensive; it doesn't go very far, and if you undertake to make a specialty, then you are obliged to leave off in the general things. A boy or girl up to 15 or 16 years old does not get too much of a general education anyway, and if part of it is taken up in a special course he gets very little of the general knowledge. I think he had better take his special course after he is out of the free schools of the State.

Q. (By Mr. SMYTH.) Will you tell us something about the farming conditions and labor, both white and colored, in South Carolina, and all the conditions surrounding it?—A. In the topics I noticed a question as to the proportion that are engaged in agriculture now compared with 50 years ago. That brings us back to 1850. I could not very well answer that question so far back, but I can take it back to 1865, when the war between the States was at an end. At the end of that war, and perhaps up to about 1876 or 1880, a very large proportion of our population, both white and colored, was engaged in agriculture almost exclusively. I do not think it is any exaggeration to say that three-fourths of our population at that time were agriculturists. We had no money; we had nothing except the lands, and mules, and horses, and such things as we could get hold of. Therefore almost the entire population, white and black, went into the agricultural business. Agriculture was very profitable, prices were high, and our people made money pretty tolerably rapidly. As they made money, they quit agriculture; the prices decreased and they went into other business which loomed up as being more profitable. From about that time to the present the agricultural population of the country has greatly decreased.

Q. You think that applies all over the State, or just to this section—the hill country in which you live?—A. I think there is a greater decrease in the upper section of the State than in the lower part, but I think it applies to the whole State, and the cause of it, I think, is the unprofitableness of the business.

Q. (By Mr. RATCHFORD.) Is there a tendency on the part of the agriculturists to drift from the farm into the city or the town?—A. Yes.

Q. Is that tendency peculiarly noticeable among the young men of to-day who are raised on the farm?—A. Yes. I believe that within the past 5 years nine-tenths of the agricultural population of our State would have quit the farm, and did quit the farm, wherever they had an opportunity of getting something better to do; not specially to go to town, but going anywhere where they could get better wages and regular employment. That is the main reason why our people are quitting the farm and going to the manufactories.

Q. (By Mr. C. J. HARRIS.) What part do you come from?—A. Greenville County, S. C.

Q. Are you able to raise cotton at a profit in your section of the country?—A. We are at present prices.

Q. How about prices last year and the year before?—A. We did not make any money.

Q. What do you mean by making money? When people go on raising crops year after year and are able to keep going, making a living, existing some way without mortgaging their farms, they must make something, do they not?—A. I did not say we lost. I said we did not make any money. The cost of making cotton is in the neighborhood of 5 cents. In our country we can raise everything we want to eat; that is, bread and meat—indulge in none of the luxuries. Then our cotton would go to the payment of the wages, and of the taxes, and there was nothing left over as profit to the landlord. That is what I mean by not making any money.

Q. (By Mr. SMYTH.) Is the farming in your country done largely by the tenant class; is land rented out?—A. Yes; it is done in all sorts of ways. We hire and we pay in kind and share of the crop, which means that the landlord furnishes the lands, mules, and everything except labor, and the tenant is paid a share of the crop.

Q. (By Mr. RATCHFORD.) What share does he receive?—A. In my section of the country we give one-half to the laborer.

Q. And who furnishes the seed in that case?—A. The landlord furnishes everything—tools and all. Then there is another system of renting. The tenant furnishes the stock. They generally pay a standing rent of so many bales of cotton for a 1-horse farm, which is usually about one-fourth, or 1,200 pounds for a 1-horse crop.

Q. (By Mr. SMYTH.) And then the tenant takes everything else?—A. He gets everything else then. He furnishes everything except the land.

Q. Is that system you mention general throughout your section of South Carolina?—A. Yes; pretty general. In connection with that, we have a wage system, paid in money. There are three systems.

Q. Under the third system labor has no share in the crop whatever?—A. No, sir.

Q. (By Mr. RATCHFORD.) What are the wages usually?—A. From \$8 to \$13 a month.

Q. And board?—A. As a general thing it will average about \$8 to \$10 a month and board. If he boards himself he gets \$13 a month. That has a good deal to do with the wages.

Q. Has he any other privileges, in the way of keeping a horse or anything of that kind?—A. He can if he wants to. There is no restriction on that.

Now, in regard to the tenant system and wages. It is invariable that they have a garden, and truck patch, and potato patch, and watermelon patch. They have that, and the hired man usually gets that, too.

Q. The tenant is the man who furnishes the labor?—A. Yes.

Q. For one-half of the profit?—A. Yes; and he always gets—

Q. (By Mr. SMYTH.) (Interrupting.) The labor that you hire for wages—how many hours; from sun to sun?—A. We have no system in regard to that; only the fact that we have to have daylight, and that regulates it. In the winter season the hours are very short. As you know, our days are short and sometimes they are cold in the morning. But in the summer the rule is to begin about sunrise and knock off 2 or 3 hours at dinner time and then go until night again. Ten or 12 hours some days during the summer and in the winter 6 or 8. There is no regulated time.

Q. (By Mr. C. J. HARRIS.) If fertilizers are used on the land, who pays for them?—A. In my section of the State it is divided—one-half, or whatever proportion the crop is bringing. In the lower part of the State, however, the rule is a little different; the landlord gives it to him and furnishes the guano. There are some sections in the lower part of the State that I have recently been in.

Q. Are fertilizers largely used?—A. Yes; on almost every farm. I do not know one that don't, invariably.

Q. Do you think, from your observation, that any new method or practice of farming could be adopted that would give better results, so that they could make cotton, we will say, pay something at 5 cents a pound?—A. That is largely a matter of speculation. Picking cotton is one of the costliest things that we have, and a great many efforts have been made to invent a cotton-picking machine, and it has been unsuccessful practically up to the present time. The next costly item in cotton raising is hoeing, and a great many efforts have been made to invent a machine to chop cotton with; that is, thin it out.

Q. Cotton is planted in a drill and comes up in a continuous row?—A. Yes.

Q. And the chopping out, I understand, is to reduce the number of plants in that row. There is about 10 times the amount planted that is needed. It is a delicate plant when it first comes up, and cool and damp weather will cause it very often to die out, and they have to plant more than is necessary, and this hoeing is to eliminate the superfluous plants?—A. Yes.

Q. (By Mr. RATCHFORD.) In case a man receives \$13 a month, which I believe is the figure you stated, what part of that is required to support him?—A. It is entirely according to how he lives. If a man will take a bread-and-meat diet in South Carolina he can live very cheap. He can live on perhaps 10 cents a day. He can spend any amount from that up.

Q. Those farm hands usually have families and rents to pay?—Yes. No rent; no. The house is furnished and his wood is furnished.

Q. They can support families on \$13 a month, can they?—A. They can, and it is entirely according to how they live.

Q. They do do it?—A. Yes.

Q. (By Mr. SMYTH.) A great deal of the work is done by minors, is it not—by children?—A. Yes, and women.

Q. And the picking is done almost altogether by women and children?—A. A great deal is done by women and children.

Q. And some plowing is done by women occasionally?—A. Yes.

Q. (By Mr. RATCHFORD.) But mostly colored labor is employed in raising cotton?—A. Yes. I suppose that, taking the whole State, nine-tenths of it is colored labor.

Q. (By Mr. SMYTH.) What has become of the white population in your section?—A. They have gone to the mills.

Q. (By Mr. RATCHFORD.) Is there any difference between the wages of colored farm labor and that of white labor generally?—A. There is some, I believe.

Q. In favor of which?—A. In favor of the colored labor. I believe that most of the farmers prefer the colored men for agricultural labor. He is stouter as a general thing, and he has been trained for several generations, and he is hard to beat at either hoeing or picking cotton.

Q. Is he generally more successful than the white man?—A. He has generally got to have somebody to instruct him and show him what to do.

Q. Have you much of what is known as the renter class among the whites in your country?—A. We have a good many, yet not as many as heretofore. A great many leave the farm and go to the mill.

Q. Go to the cotton mills?—A. Yes.

Q. They were very migratory people, were they not, moving from farm to farm every year?—A. Yes. Well, a great many of them were not. A great many of them that have gone to the mills were landowners, and they were a pretty good class of people.

Q. They have rented out their farms?—A. And they found with the depression of agriculture that with the same amount of labor they could make more money in the factory, and it has induced a great many people to leave or sell their little farms.

Q. If they did not sell they would rent to somebody?—A. Yes.

Q. Very often to colored people?—A. Yes; they have done so, yes.

Q. In that way a gradual change has come over the condition of the laboring class among the farmers of your section in the last 30 years? A great many white renters have left the farm and gone to these cotton villages, and their places have been taken by colored people?—A. Yes.

Q. Has not that resulted in drawing some of the colored people that were indolent and nonworkers around the towns out into the country again?—A. I don't think so. We are scarcer of agricultural labor this year than we have ever been in my section of the country. The colored population are inclined to leave the farms, too, but instead of going into the mills to work they are inclined to go to towns to do jobs, such as washing, driving—anything of that sort.

Q. (By Mr. RATCHFORD.) Have the wages of agricultural laborers advanced in proportion to the advance in the cotton product?—A. Yes. Usually during the period of 4 to 5 cent cotton it went down. Farmers could not pay the amount they are now paying.

Q. (By Mr. SMYTH.) And those tenants who had a share of the crop had less value for their labor?—A. Yes.

Q. And as cotton has advanced in price those who are working on shares have been getting a larger return?—A. Yes.

Q. (By Mr. RATCHFORD.) That also applies to those who are employed by the month?—A. Yes. They get better wages this year than they have had for several years.

Q. Is there any diversity in agriculture in your part of the State?—A. Not a great deal, sir.

Q. No tendency toward it?—A. We plant mainly corn and wheat; not very extensively of wheat and oats; some rye, some barley, some molasses, and the bulk of our crop is cotton.

Q. (By Mr. SMYTH.) You can not raise cotton in your section of the State without the use of fertilizer?—A. We can not. I know of no section of South Carolina where it can be successfully done.

Q. (By Mr. RATCHFORD.) What is the average cost per acre for the use of fertilizer in cotton?—A. I expect the average would be about 200 pounds of commercial fertilizer, which has gone up considerably this year.

Q. Two hundred pounds per acre?—A. Yes. Where land is well attended to, and gets that every year, and is worked in cotton, it will increase its value a little, and after a while produce more.

Q. What is the price of that 200 pounds at present? Do you know?—A. The standard guano is selling to-day in our State at \$18 per ton. It is according to the per cent of ammonia and other ingredients.

Q. About \$1.80 an acre?—A. Yes. Well, that does not take into consideration any homemade stuff that we have.

Q. What you have to purchase on the market?—A. Yes; commercial fertilizer.

Q. Congressman White, of North Carolina, has given this commission a good deal of information about the lien law, and the laws of that nature. Is there any such law in your State?—A. Yes.

Q. What are the conditions, and how do they operate?—A. I think that lien law has been beneficial to the poorer class of people in our State, to take it as a whole. It has been abused, and a great many hardships have accrued from it; but wherever a man made the effort to rise the lien law has been of some benefit to him. For instance, you take the young man who marries and gets out and rents a farm, and he is going to lay by what he makes. He must have something in the shape of credit; he has no money, and he really has nothing but his labor. The lien law in South Carolina enables him to give a mortgage, as it were, upon his labor for his actual necessities. In our State where it is carried out it can not be for anything except actual necessities. It can not be for a Sunday hat, a Sunday pair of shoes, or anything of that sort. It must be something absolutely necessary to make that crop. That is not strictly adhered to, and a great many men get anything they want and need; but when it comes to the courts they have held that it must be necessary to the production of crops or it can not be collected except under ordinary process of law. The lien law was much more used in our State a few years ago than now.

Q. (By Mr. SMYTH.) It is becoming obsolete?—A. It is becoming more and more so every year. Our people seem to be changing their ideas gradually, and where they have not the capital to make their crops they usually go to the banks or to some individual.

Q. Have the number of banks increased in your section?—A. Yes; the banking facilities have increased. I think 2 or 3 years ago there was but 1 bank about Greenville. I think there are 4 or 5 there now. Then other towns had none at all. They have gradually increased the banking facilities here.

Q. Do they largely do that business of loaning to the farmers?—A. Instead of going to the loan merchant he goes to the bank and pays the regular rate of interest.

Q. (By Mr. RATCHFORD.) What is that regular rate?—A. The law of the State allows 7 per cent if no contract is made; 8 per cent under special contract.

Q. Is 8 per cent the maximum?—A. That is all the law allows. If a man pays more than that he does it of his own accord, and he has got redress in the law.

Q. Does it often happen that he is asked to pay more?—A. I do not know of a single instance now where more is demanded.

Q. In cases where the tenant agrees to furnish the labor for one-half the crop how does he manage to live until that crop is produced and marketed? Does he borrow money of the banks and give a mortgage on the crops?—A. If I make a contract with a man there is competition for labor in the country to bring it to that point. I give him the option: I will advance you so many dollars on that crop at a certain rate of interest, or you can go to the merchant or bank, or anybody else you please, and get your money or your supplies. In that case, with the crop where you pay in kind, the landlord must sign what is known as a quit-claim; that is, that he will be "hands off," because the law gives the landlord a lien upon the tenant's crop for any supplies that he may furnish him that are necessary to the producing of the crop, and if he furnishes it he is the first man that is paid.

Q. Unless he signs the paper to the contrary waiving that right?—A. Yes; he can waive that right.

Q. (By Mr. SMYTH.) Is the condition of the agricultural laboring class better to-day than 35 years ago?—A. I do not think it is. I do not think it is as good, because 35 years ago agricultural products were high. I do not recollect exactly, but I believe cotton was somewhere in the neighborhood of 18 to 20 cents. Corn was as high as \$1 and \$1.50 a bushel.

Q. And you think labor on the farm shares in the advance in the agricultural products and shares in the loss?—A. It undoubtedly does. I can not see it in any other way. Transportation has a great deal to do with the progress of the country. We have no water facilities in our part of the State; they have in the lower part of the State. The railroads can kill off any town that they want to, because they can discriminate for or against it. You can buy corn very cheap up in the Northwest. When corn is needed down South here, say at Charlotte, it costs more to bring it here, I expect, than it does to buy it. Then again, on some systems of railroad it seems impossible for them to see the justice or necessity of having certain distribution points. The railroad laws of the country give them that privilege because of competitive points. For instance, they will haul a car 30 or 40 miles farther away for less money than they will drop that car for on the way, and in that way they can build up one town and kill off another.

Q. (By Mr. RATCHFORD.) Have you noticed the injurious effects of that policy in any particular part of your State?—A. I think I have, sir. You take all towns around Greenville—it is a competitive point; more than one system of railroads enter in there. They will bring goods from another point to Greenville cheaper, and pass right by local stations, enabling the merchants at Greenville to sell their goods cheaper than other places; and it is a difficult point to get at. I can not suggest anything in the way of remedy, because we have a railroad commission in South Carolina, and you apply to them for redress upon any of the wrongs and injustices, and if the railroad passes out of the State, then it interferes with interstate commerce. I have recently thought that that is one thing that the Federal Government ought to take into its control—the regulation of the transportation department all over this whole country.

Q. Do you mean Government ownership?—A. No, sir; I do not, but supervision and regulation.

Q. The railroad commission of South Carolina has power to regulate these inequalities if it would?—A. Yes; in the State.

Q. Under the law?—A. It is a local matter, and we are a small State, and our railroad commission doesn't benefit us if we have to be confined to South Carolina. Our main road through the principal part of South Carolina runs through several States, and only a short distance, about 100 miles, in South Carolina, so we have very little control. I am clearly of the opinion that the interstate-commerce law needs revision some way or other.

Q. (By Mr. SMYTH.) Do you not think their powers ought to be enlarged?—A. Their powers ought to be enlarged, and their requirements should be extended.

Q. In the line you suggest of supervision and regulation of freight charges?—A. Yes; and passenger rates, too.

Q. You think, then, that the tariff or classification should originate with the Interstate Commerce Commission, instead of being suggested to them?—A. It seems to me it is necessarily so in order to make it effective.

Q. You think the Interstate Commerce Commission should have such power that its decisions in such cases would be enforced until passed upon by the court?—A. Yes.

Q. Not as it is now—suspended until the court acts on it?—A. Yes; that is the point exactly. I think that change ought to be made, and some other changes, too. I think that the rule in regard to competitive points needs changing. I do not see the necessity of passing by a station and carrying a car to another station for less money. Take, for instance, a car that I might want to send to Fountain Inn, and some other fellow would want to send one to Greenville, living farther away; he would get his 10 cents cheaper. I do not think that ought to be allowed. In regard to the ability of a man to get labor, I know that is a question that is mentioned. I do not think there is a man in South Carolina that can not get work to do if he wants it. There are times when he can not get as big wages as he would like. That has been for several years past; but still he can get work, and it will enable him to keep soul and body together. We have no trouble about that.

Q. You have no idle class in South Carolina?—A. We have no idle class except the voluntary class.

Q. The loafers?—A. Yes.

Q. Do we understand you to say there is work in South Carolina for everybody who wants it?—A. Every man, woman, and child who wants it can get work in South Carolina.

Q. (By Mr. RATCHFORD.) Get it, generally speaking, the year round, can he?—A. Yes; he can. We have a demand for labor that is constant. I have not seen the time, certainly since 1865, when there was not a demand for labor in our State.

Q. What employment is usually afforded to these people in the winter season?—A. On the farms it frequently occurs that the cotton is not picked out at Christmas. It does not quite get finished if there is a big crop like that of year before last. There are quantities in the field at Christmas, and immediately after Christmas you have got to begin the preparation for another crop of cotton. All the fall the small grain is put in, and the cotton is to pick. That is the main point. It is cotton—pick cotton.

Q. (By Mr. SMYTH.) Picking cotton costs about $1\frac{1}{2}$ to $1\frac{1}{4}$ cents per pound?—A. No; it doesn't cost us that much. We cut it down for about 40 or 50 cents a hundred pounds. That is seed cotton.

Q. But in the lint it amounts to $1\frac{1}{2}$ to $1\frac{1}{4}$ a pound, does it not?—A. Yes; just about.

Q. (By Mr. RATCHFORD.) Then the employment that is offered is farm work all the year round, is it?—A. Yes; and whatever business a man follows; whatever kind of labor he can get all the time.

Q. (By Mr. SMYTH.) These cotton mills you speak of around you are constantly drawing on agricultural labor?—A. They are.

Q. There are a great many new mills being built, you said?—A. Yes.

Q. Constantly inviting people away from the farm?—A. More people left the farm during the last year or two than ever before.

Q. They leave because they can make more money at the mills and are better satisfied?—A. Yes. And then another thing: some of the mills—and that especially in case of the Piedmont and Pebyer mills—have appropriated liberally, added to the appropriation of the State for the schools, and some of them keep first-class graded schools for 8 or 10 months in the year. That is an inducement to people who want to give their children something of an education.

Q. Do you favor a compulsory school law?—A. No—yes; but I will favor it up to this point, to require a child to read and write. I would favor it up to that point, but no farther.

Q. (By Mr. RATCHFORD.) At what age would you favor children entering the factory?—A. Well, it is to the interest of the companies, and, now that they have the opportunities here, I do not think they ought to put them in the mills until they have got a pretty fair education, say 16 years old. On the other hand, when I see a family left—a widow with a parcel of children without any ability to support them, and they have just got to do anything they can, I think it is far better to allow her to put the children in the mills.

Q. Have you any law in your State regulating the hours of children?—A. Yes, sir.

Q. And regulating the age at which they shall enter the factory?—A. I am not sure about the age.

Q. What are the hours?—A. Eleven hours. Like everybody else, we have some people that are trifling. We have parents—

Q. (Interrupting.) Is it your opinion that a just statute might be framed making exceptions of such cases as you have pointed out, and accomplishing at the same time a great deal of good for the children?—A. In the way of compulsory education?

Q. No; in the way of limiting the age of children at which they shall enter the factory, making exceptions in the case of a widow, for instance, who has no other visible means of support.—A. I believe it is best to leave it without legislation. It sometimes works a hardship. A trifling fellow will put his children in the mills because he does not want to do anything himself. On the other hand, if you entirely prohibit it—

Q. (Interrupting.) Is not that a general rule, or is it an exception, that fathers and mothers will put their children in the factory or workshop when they really could afford to get along without their wages?—A. I think that is the exception. That is my observation. In fact, they frequently all go to work together where they are obliged to.

Q. (By Mr. SMYTH.) You have been a member of the legislature and of the State senate in South Carolina?—A. Yes, sir.

Q. You are somewhat familiar with the conditions in the State, as you have testified?—A. Yes, sir.

Q. (By Mr. RATCHFORD.) I would like to know if you have something to suggest in the way of the improvement of the agricultural classes by an educational system.—A. I do not think that anything should be done in America—not only in the South, but anywhere in America—that would impede the progress of manufacturing. I do not care whether the cotton is manufactured in Massachusetts, Maine, or Vermont, or anywhere else, but I should like to see the cotton of America manufactured here. If corn has got to be shipped to England or Germany to make whisky out of, I think it ought to go in the shape of whisky. In the same way, I think our wheat should be ground up—

Q. (Interrupting.) Your policy is to have our home labor do the work?—A. Yes, sir; and have the products sent abroad in a manufactured state. I think the time has passed when one part of the Union ought to be in competition with another. I believe if the manufacturer in South Carolina can make more money than one can in Massachusetts, it would be the true policy of the fellow in Massachusetts to go down South. He would still be in America. I think he ought to go wherever he can make the most money.

Q. And he could get along?—A. He certainly can. I think we have started in on a wave of prosperity. I am an antiexpansionist, but, at the same time, I think we ought to extend the markets of our manufactured stuffs, and, as I see it, we can do it without taking possession of the territories of the world, especially such places as the Philippines.

Q. (By Mr. SMYTH.) We will not go into politics. You were speaking of business conditions?—A. Just referred to that—to the opening of markets. If we can not sell our manufactured products here, send them abroad. We ought to quit producing raw material for some one else to manufacture.

Recess from 1.50 to 3.15 p. m.

The WITNESS (recalled). I meant to say a little on the pure-food and drink and light question. I think it is of the utmost importance for the United States Government to pass most stringent pure-food laws for the entire land, including everything that a man eats, that is put up for market, and everything that he drinks, and fuel that he is allowed to burn. When you go to a merchant in South Carolina and ask for a barrel of flour, for instance, you have no reasonable assurance that it is not adulterated, and the whole land is directly interested in pure-food laws. The drink is not so important, because we can drink water; but still some of our people do not always drink water, and, therefore, the drink ought to be included; it should be pure. So with the oil that is sold for illuminating purposes. There is a vast number of people not living in towns and cities where they can get gas and electric light, and, therefore, we are dependent on some kind of illuminating oils. Some of the States have very stringent laws on adulterated oil, while others have not, and it is very difficult to enforce laws where they are not uniform.

I just wanted to make this suggestion, that the United States Government can not make too stringent laws in regard to these matters—food, drink, and light, fuel of every description. Whatever it is it ought to be branded, so that if a man wanted impure stuff he could get it; but if a man really wants wheat flour, or anything else that he wants, he should have some assurance that it is pure, and the punishment ought to be very severe.

Testimony closed.

CHARLOTTE, N. C., March 13, 1900.

TESTIMONY OF MR. THOMAS E. MILLER,

President of the Colored Normal, Industrial, Agricultural, and Mechanical College of South Carolina.

The subcommission of the United States Industrial Commission met in the rooms of the Southern Manufacturers' Club at 10.40 a. m., Mr. Smyth presiding. Mr. Thomas E. Miller was introduced as a witness at 3.18 p. m., and, being first duly sworn, testified as follows:

Q. (By Mr. SMYTH.) Please state your name.—A. Thomas E. Miller.

Q. Place of residence.—A. Orangeburg, S. C.

Q. What is your occupation?—A. I am president of the Colored Normal, Industrial, Agricultural, and Mechanical College of South Carolina.

Q. If you have any statement that you would like to make in reference to the college or your students, labor conditions, or anything else touching upon agricultural or mechanical affairs in South Carolina, we shall be very glad to hear you.—A. I should like first to start with the public-school system, and after that I will come to these manual-training schools. The public-school system of South Carolina is not what it ought to be by any means. The State is taxed sufficiently—that is, in proportion to its income—but that taxation does not yield enough to support the schools in the way they should be run. In the towns and cities the whites and negroes are fairly provided with houses, books, school fixtures, and a good grade of teachers, but as soon as we strike the country districts it becomes a makeshift for both races, more especially for the negroes. No person can complain against South Carolina for the negro as far as appropriating money for negro education is concerned. Taking the circumstances and regarding the conditions, it is my wonder that she has done so well. The negroes pay about one-ninth of the taxes; it may be less. We have no statistics by which we can get at these figures. The school fund from the 3-mill levy and the poll tax is prorated to each school district on the attendance of the previous year. After that prorating is made it becomes the common fund of the district, and then the identity as to race is lost. As to the use of the money after that particular time, it depends entirely on the class, ability, and conceptions of the trustee. Hence we find the condition of the races in one township quite different from what we

find it in another. Then, again, the salaries of the negro teachers and the white teachers are not on the same scale. It is about as 1 to 3.

Q. (By Mr. RATCHFORD.) That is, the white teacher receives about 3 times the amount?—A. No; the difference is not so great. It is about 1 to 2.

Q. Twice the amount for services as teachers?—A. Yes, sir.

Q. (By Mr. SMYTH.) That is general?—A. That is general.

Q. Do you think that applies to Charleston?—A. I will get to Charleston. Generally the exception only proves the rule. In 2 or 3 cities, including Charleston, Columbia, and perhaps Darlington, there is very little difference in the payment of the teachers for the negro and the white race.

Q. A good many of the teachers in the Charleston colored schools are white, are they not?—A. In Charleston all with the exception of 6 are white, and the boys' schools in South Carolina—I do not know about the town of Greenville, but the boys' schools in South Carolina, outside of Spartanburg and Greenville, have both races. If the schools over the State were on the same scale of elevation as in Charleston we should not need any assistance, but they are not and can not be so on account of the small amount of money. When you take into consideration the fact that we have more negro schools in the State than we have white public schools and that we do not pay over one-ninth of the school taxes, it is a surprise to us negroes that we get the great amount of the school fund that we do.

As to the manual-training school, there should not be an attempt made to establish manual-training in the public schools in the country, but every city graded school for white or black ought to have a manual-training department; but where to get the money to do that is a mystery, because our educational system costs us more than any other branch of our government. For all State purposes outside of education we levy 5 mills and for educational purposes we levy 3 mills, and to that is to be added \$1 per capita for each adult male below 50 years of age.

Q. That is the poll tax?—A. Yes, sir. When you take the poll tax and the 3-mill tax and add that together you will readily see that half the State taxation of South Carolina goes to the common-school educational system.

Touching the illiteracy of South Carolina, up to 1840 there were not over 13,000 white children, out of a possible school population of 120,000, attending the free schools. Up to 1860, out of a possible school population of 150,000 whites, there were not over 30,000 in the free public schools. Those were the conditions that confronted us at the breaking out of the war. Our school system was obliterated and wiped out during the war. Hence, when we started to keep house, so to speak, again after the war, that great illiteracy among the white people that existed on account of the small provision made previous to the war for public school education was on us, and its shadow still lingers over the State. The school population of negroes at the present time is not less than 300,000.

Q. What ages do you include in this?—A. I get it this way: We have 145,000 males over 21 years old. I multiply that by 5 and that will give us the entire population; then divide the product by 2, which will give the school population, allowing one for women, one for men, and the other for the children who are out of the school population. That will give us at least 300,000 between the ages of 6 and 21. These people, to be the citizens that this Government was founded for, must be educated. The whites, who own nearly all the property, to remain progressive and leading citizens, by all means must be educated, too. But how? Not like parrots, but in the school of utility. If, on account of our impoverished condition, by reason of being purely an agricultural people and having thrown on us a great horde of ignorant citizens by emancipation, we are precluded from giving to the entire people an education of utility, where should we look for assistance? Why, of course, to the General Government. And why? Because there is not a thing that we can produce in elevated citizenship but adds wealth and stability to the General Government. She needs this elevated citizenship that we should have, and she needs to have our industries developed. Then, as she needs it and is able to provide the means by which she can get it, it is her duty absolutely to give us the means. This is no new thought of mine. It was made plain to me by Senator Blair when I was in the Fifty-first Congress, and my heart bled when I witnessed the destruction of his bill asking national aid for public schools.

Q. (By Mr. RATCHFORD.) I want to ask whether this marked illiteracy in your State was not as fully apparent before the war as it has been since?—A. Yes, sir; but the conditions were different.

Q. (By Mr. SMYTH.) Was it not largely due to slavery?—A. I said the conditions were different. The man of property and of means educated his children mostly abroad. The poor man who had to compete with slave labor never got the opportunity to educate his children, and the Government was responsible as well.

There was a great mass of black humanity that had to be kept ignorant if slavery was to exist. The ignorance was apparent, but we could throttle it—could manage it.

Q. (By Mr. RATCHFORD.) Your answer is, that prior to the war you had that mass of humanity throttled?—A. Yes, sir.

Q. And were able to control it so as not to interfere with the progression that naturally follows emancipation and the exercise of citizenship?—A. You mean, have been able to control it since?

Q. I understood you so.—A. No; we have not been able to control it.

Q. The lack of education was as apparent before as since?—A. Equally apparent.

Q. In those days the citizen had not the same task to perform toward his Government?—A. He did not have it, but I could go back as far as the days of Governor Moultrie, right after the surrender of Cornwallis. His first public message was that means should be provided whereby the laboring white man could be educated. That was one of the first things that he recommended.

Q. (By Mr. SMYTH.) Previous to 1860 there was no law that prohibited the poor white children from attending the schools, but the facilities were not offered them. The schools were not there, and there was a lack of incentive on the part of the poor whites to educate themselves.—A. No lack of incentive, but an absolute lack of facilities. The schoolhouses, after you left the towns and the steamboat and railroad stations, were only at great intervals. Take the counties of Hampton, Beaufort, and Colleton, where I spent my boyhood days. As soon as you leave the pine resorts, where the gentlemen live, as soon as you leave these little clusters, you do not see any schools for white people at all.

Q. (By Mr. RATCHFORD.) Is it your opinion, then, that this seemingly unanimous demand for education in this State has come as the result of the increased responsibility of its citizens?—A. Yes, sir; yes, sir. Put that down "yes" twice. There are two classes of citizens—the struggling mass of people, natural citizens, and the newly made citizens. Ignorance added to ignorance, and our capacity to meet it and enlighten it is not equal to the task.

Q. (By Mr. SMYTH.) It has also largely come as the result of freedom?—A. That is it.

Q. Freedom for both—freedom for the colored and freedom for the white?—A. If you speak of the double emancipation, this responsibility comes from the double emancipation of the South.

Q. (By Mr. RATCHFORD.) What do you mean by double emancipation?—A. The white people themselves have been emancipated, so to speak, from the conditions that surrounded them. I do not mean the poor white people, but the white people generally—a thralldom like death that they could not get rid of. In 1810 the two Carolinas, Georgia, and Virginia manufactured more goods and better goods of all kinds—machinery, clothing, woolen and cotton, and sheets, and harness, etc.—than all of New England put together, according to the United States census. The very thing that drove our manufacturing institutions away from us was the conditions that surrounded us—the slave labor here. Our manufacturing institutions just perished one by one.

Q. Before you leave the subject of public schools, have you any recommendation as to increasing the facilities or improving them in any way?—A. We can not tax ourselves any more.

Q. You think the limit is reached by the State?—A. Yes, sir. I have voted for educational purposes about 18 years, and each time I cast a vote to tax the people for educational purposes I felt that I had reached the limit.

Q. Do you concur in the opinion of the previous witness that the Federal Government should do something to that end?—A. Absolutely; not only for the public-school system, but to assist in giving, as an auxiliary to these higher graded public schools, manual training.

Q. Have you any additional reasons to offer, supporting the reasons submitted by the previous witnesses, why the Federal Government should do this?—A. I think I have gone over them. You know I stated that if you give us a better citizenship and give us more products, the General Government will get the benefit of it, and as we were too poor to do it, it is absolutely the duty of the General Government to give us the assistance.

Q. (By Mr. SMYTH.) Do you not think the condition of the Southern States is peculiar in the fact that we had after the civil war an immense mass of illiteracy thrown on an impoverished commonwealth to educate? The State of South Carolina was poor, and then we had this tremendous volume of uneducated people to educate. It is not so in any other State.—A. Yes, sir; the State was impoverished. Not a blade of forage was left growing, and all that was growing was either consumed by both armies or destroyed. Every building, except a few

churches, were burned, absolutely razed to the ground; and nothing at all left for the people to subsist on. That was the way we started again.

Q. So that it is because of your poverty in South Carolina that you think the General Government should help educate?—A. On account of our helpless poverty. That is one of the reasons I brought in and urged for the success of the Blair bill that was lost in the Fifty-first Congress.

Q. (By Mr. C. J. HARRIS.) You think you have reached the limit of taxation that you can raise yourself?—A. Yes.

Q. You know, of course, that is a novel proposition; never has been followed yet in any of the States or Territories.—A. I do not know of its being followed. I have no precedent for it. But the reports and the debates on this very proposition from Mr. Blair, of New Hampshire, are generally unanimous that it is the Government's duty, whenever the people are impoverished and unable to enlighten themselves, to take it up and do it.

Q. I understand it is a new matter.—A. All the reports are favorable and the debates were generally favorable.

Q. (By Mr. RATCHFORD.) If there is no precedent for such a claim, which I think is proper and right, is it not also a fact that there is no other case in which there are such justifiable demands for the making of a precedent?—A. I do believe, sir, that you have stated the case correctly, and that if the Federal Government lends its assistance in that way, the South will not only be in a condition to help itself in a short time to a very great extent, but also be of general help to the entire country.

Q. You believe that is true?—A. Yes, sir; I do believe it, and I base my belief on past experience. The next topic is national aid to technical or manual training schools on the higher plan, such as Clemson, or as I hope to make the one that I am building. I agree fully with what has been said here in relation to the needs of Clemson College. The means of training Southern youths to manipulate yarns and fabrics ought to be encouraged and assisted, because the favorable conditions that exist in the Carolinas, Georgia, and I will say Alabama, too, for manufacturing institutions are peculiar to their locality. Their environments are such as are not found in any other territory of the United States. Every one of the States has the fuel that is necessary; most of them abound in undeveloped water powers. We can develop water power here, horsepower after horsepower, in any one of the Carolinas, Georgia, and Alabama cheaper than they have been developed in the New England States. That is the report of the Government surveyors who have surveyed our undeveloped water powers.

Q. Describe the fuel; what is it?—A. Coal and our forests. We can for a long time furnish wood at any one of the factories that would be entirely dependent in these States on wood for years and years, at a cost not greater than \$1.50 or \$1.00 a cord. If you take our pine forests for fuel, they are exhaustless. It replenishes itself every 10 years.

Q. Your coal deposits, are they large?—A. I have heard it said that the coal deposits in Alabama and Lower Tennessee are sufficient for all these Southern States for all time.

Q. You have no coal in the Carolinas?—A. We have some coal, but as to its quantity or quality we have no certain survey. We have some in Spartanburg County. But they have coal in Georgia and in Tennessee, and I have been all over the coal field in Alabama. I spent 7 weeks day after day traveling over Alabama, by wagon and by rail, just 7 years ago. Now, where factories come to these Southern States—

Q. (By Mr. SMYTH, interrupting.) By factories you mean cotton factories?—A. Yes; cotton factories. We have not a supply of skilled manipulators, educated manipulators, and it is almost impossible to get them. How much better it would be for us to develop the native talent and prepare the young men to do that class of work. Then, again, we need skilled dyers in these cotton factories, and as a part of this textile training they would be taught to manipulate the different chemicals or the natural dyestuffs, to enable us to compete with other markets in the finer prints. Then, again, the Government ought to assist in educating our young men in the science of bleaching, so that we should not have to depend upon imported talent for that branch of the industry. I say the Government should do it, because every additional wheel in the way of manufacturing that is started up or caused to turn enhances the wealth of the Government; but if these wheels are started in incompetent hands the thing collapses and the Government in the end is the sufferer. You may ask, "Do you make the same claim for the negroes?" Most assuredly, to a limited extent. Our field of operation would be smaller in the start, and hence we should not need so great assistance as the whites. You may ask what data I have to prove that the negro is a com-

petent manipulator of fabrics or that he could be educated to become skilled in the management of such affairs. I go back to periods previous to the war for my data. It is reported in one of our histories, compiled by Colonel Butler, between 1882 and 1886, that one of the best-paying cotton mills, established in 1847 or 1848 and continuing to run and declare large dividends until it was destroyed during the war, was run, manipulated, and managed by 1 white man and some 98 to 120 negro hands under him. It is the old Saluda factory, that stood a few miles out of the corporate limits of Columbia, S. C.

Q. That mill was burned by Sherman's army, was it not?—A. The mill was burned by the soldiers marching through Georgia during the war, better known as Sherman's army.

During the Confederacy the cotton and woolen factories at Tuscaloosa, Ala., were run with negro labor, with one or two white people detailed by the government; and some of the best workers in wood and iron are still among the negroes in the South to-day.

Q. The Charleston company is being run with colored help to-day, is it not?—A. Yes.

Q. Is equally successful?—A. The cotton mill in Charleston for the last 10 years has been equipped with old-fashioned, antiquated cotton machinery. The white laborer failed to make it pay. A gentleman by the name of Mr. Montgomery has taken hold of it, and has taken out all of that old machinery, thereby adding an additional cost to the plant, and he expects to declare a dividend on the entire stock with negro operators. In most of our machine shops and government armories where arms were made in the South during the war the negroes in numbers predominated. They can be taught the mechanical arts as quickly as any other people from any clime, condition, or country. They are a satisfied portion of humanity. It takes very little to make the negro happy and contented. He has been called by the people who conduct phosphate mining, by men who work hands on the railroad, by the people who work in shops where they are, and by the farming white men of the South, the best labor that has ever been given to the white race by God. A thing that is as good as the negro is ought to be given an opportunity to help in developing the resources and the wealth of this country. As he is poor and helpless on account of his long service in bondage, and has not been free long enough to assist himself, it is absolutely the duty of the General Government, since his State is too poor to do it, to assist him in that way. I could ask this commission to help with a nest egg, which you could give right at my school; some assistance in the way of fitting up a textile school.

Q. Textile school?—A. In the Treasury of the General Government there is a large amount of money due to dead soldiers, negro soldiers, that has never been claimed, because they have never been able to find out the identity of the persons to whom the money belongs. It runs away up into the thousands and thousands. It would be well for the United States Government to go over their muster roll and prorate that money according to the States that these soldiers came from, to assist in equipping the textile training schools. The State of South Carolina has already established a manual training college at Orangeburg, and it is my good fortune to be at its head. We have there in the way of industrial departments blacksmithing, plumbing, wheelwrighting, carpentering, wood-working by machinery, such as sash, blinds, furniture, flooring boards, molding; we have bricklaying, plastering, stone fitting and setting, painting and graining, that is for boys. For girls we have the laundry, cooking, and domestic economy. I am about to erect a new set of workshops. Our trustees met last week and appropriated the money for me to begin the building with, and it is my intention to devote the second floor of one of the wings, 45 feet by 90 feet long, to the purpose of inducing some person or persons, government or governments, to fit up therein a textile training school. I have here the plans of that building, if you gentlemen would like to see them. And these drawings will also show the capacity of one of our instructors there. We have a man there by the name of John R. Steele, superintendent of brickwork, plastering, and stone setting. All the education he received before coming to me was what he got out of Mr. Doty's high school at Charleston—that is the public high school. I consider him one of the finest architects you will find anywhere. He has learned his profession there, and I have some of his work here.

Q. (By Mr. C. J. HARRIS.) Is he a colored man?—A. He is a black man. He is not mixed as I am. I want you gentlemen to see what kind of work we are doing there. The boys under Mr. Steele are taught to draw these plans that I have here, and from them do the work. [Witness exhibits plans.] This drawing [indicating drawing] is the Morrill Hall, designed, drafted, and erected by my instructors, Steele and Gruber, with the labor of students. The estimated cost, including

the building and labor of this building, was \$45,000; but on account of workshops we made all the lumber in that building, and with the cheap labor of the students we have erected this building at a cost of \$21,000.

Q. (By Mr. RATCHFORD.) Less than one-half the estimate?—A. Yes; but I want you to look at the work. That is the work of a negro who has never seen the inside of a school of architecture.

Q. (By Mr. C. J. HARRIS.) Are your teachers here all negroes?—A. Yes, all are negroes, and everything in that catalogue I teach in reality. We have about 600 boys and girls; everything that you see in this catalogue is taught in the school.

Q. I see you have a list of instructors. Are they all colored?—A. Every single instructor in this school is colored. That is one of the provisions of our by-laws; the white people, when they gave us the college, insisted that all instructors should be colored. I want to tell you something about the board of trustees. Of my own selection, every member of the board of trustees is a white man. The governor of the State asked me if I did not want two colored men among the seven on the board. I told him that I did not want any on the board colored. I could have gotten all if I had wanted to, but I did not want to kill the school. My reason for not taking any colored men on the board of trustees was simply this: I should have to go to the legislature every year for my appropriation, and I wanted the very best men which the State of South Carolina produced to stand between me and the legislature. Now I want to talk with you about how we run these schools. The first year we opened this college we had over 1,100 students, but the illiteracy among the student body was so great that we had to pass a by-law cutting off all boys and all girls who had not passed their seventh grade in the public school. If we were to take all boys and girls between the ages of 14 and 20, I should have between 2,000 and 3,000 students at the opening next fall.

Q. (By Mr. RATCHFORD.) You had to raise your qualification?—A. Yes; so as to cut them off; we had no room. And now it is hard to get boys and girls from the country on account of the shortness of the school-term calendar there.

Q. Tell us something about the cost of tuition.—A. This negro school has been free so far from agitation on the point of tuition, hence there is no tuition charged there. One dollar incidental fee for the entire course of 7 months is all the student has to pay outside of his board and clothing. To relieve the trustees of responsibility for the board bill of students, I guarantee to run the boarding department at a cost of not more than \$5 per month for each boarding student. Any boy, while we are building, without detriment to his education, can earn \$4 of his \$5 board every month, leaving the cost of the boys who are not dudes or drones—and we have a few of these—on their parents, of about \$2 a month. We have very little help for the girls. Out of 120 girls in the boarding department, I employ 32 at a salary of \$1.50 a month, reducing their expenses to \$3.50 a month, plus the \$1 for the whole year's incidental expense. The first year I came out \$800 in debt; I was green. The next year I came out \$32 ahead; last year I came out \$37 ahead. From this you will see that the boarding department is not run for profit. In the way of assistance from the State, if our farm receipts are sufficient, over and above expenditures, the trustees are obligated to pay in full one month's board for each boy or girl who has attended consecutively for 5 months of each school year. I am also manager of the farm, and I have always made over and above the expenditure of the farm sufficient for the 1 month's board guaranteed by the trustees. We have a farm of 65 acres of cleared land, or land that can be cultivated. Since I have been there I have cleared up and reclaimed 20 acres more, making a farm now of 85 acres, with the possibility, when I shall have reclaimed the swamp, of 120 acres. The income of the farm is dairy products, calves from the milch cows, pigs, potatoes, cabbages, turnips, and a limited amount of cotton, hay, pea vines, etc. In connection with farming for profit we conduct experiments in our grasses and forage crops, and also have been testing the food value of pea vine in feed to fatten hogs; and we have found it to be an excellent food for hogs. The girls and boys are taught dairying; the boys are taught scientific farming. Of course all around on the farm some are in one or the other industry.

Q. Are the courses elective?—A. The courses are elective. When a boy comes in he is asked which one of the courses he wants—he must take one trade; then he sticks to that trade. During the 3 years I have been at the head of this institution we have made first-class bricklayers, wheelwrights, blacksmiths, and plasterers. The buildings in the catalogue have been all built by students. They have been all directed by 1 or 2 mechanics in the woodworking department, but all of the brickwork and plastering has been done by the students.

Q. (By Mr. SMYTH.) What do you consider the cost of your buildings?

The WITNESS. You want the actual cost?

Mr. SMYTH. No; what they are worth?—A. The buildings that the State of South Carolina put there—45 and 22 are how many?

Mr. SMYTH. Sixty-seven.

The WITNESS. Sixty-seven; and the shops are 8—our buildings could not be replaced for less than \$73,000 or \$74,000. All of them, except the workshops, have been built by the State during the last 3 years. The workshop was built by the State about 10 years ago.

Q. How long has this institution been in existence?—A. This institution was made possible by the last constitutional convention, convened in 1895. I was elected its first president in May, 1896, and under the provisions of the bill was compelled to open up school that year to retain the land scrip and the Morrill fund. By December of that year, having had the workshops and machinery to make my boards and lumber, I had Bradham Hall completed; that is shown in the catalogue of the first year. The estimated cost of the white architects was \$22,000; we paid for that; we did not have this man Steele then. With student labor the building was completed for \$11,700. The second building, Morrill Hall, was completed last year. The ground was broken March 8, the year previous. It is 157 feet long, 92 feet wide, with a tower having 3 tower rooms in it. The last one is for astronomical purposes. We expect to make it a grand observatory. It is 24 feet in diameter, so if we succeed in getting an instrument of 23 feet, we can revolve it there. That is this building here, sir [producing drawing and indicating building].

Q. (By Mr. RATCHFORD.) Twenty-four feet?—A. Yes. Now, without the aid of the United States Government—that is, without the land scrip which was given us by the act of 1862, and without the Morrill bill which gives us \$13,000 a year on account of the impoverished condition of South Carolina; we being purely an agricultural people, and farming having almost ceased to pay on account of the low prices of cotton in the past—it would have been impossible for South Carolina to appropriate the money she has to build these buildings. All of the money expended on the buildings has come out of the treasury of the State of South Carolina. No portion of the United States funds, land scrip, Hatch fund, or Morrill fund can be used for buildings or for the purchase of land. Relying upon the issue I have made here as to the results accomplished, and knowing the great needs resting upon us before we can do better and accomplish more, and seeing as I do the dense ignorance and incapacity of my people in South Carolina, these reasons are causes for me to rest my claim upon aid from the General Government in the future.

We did not touch the agricultural portion. Everybody that has testified has gone over that pretty thoroughly. There is one thing I would like to say: That it is my belief that a great deal of the agricultural unrest—that is, the tenants leaving their holdings—is due to the laws of South Carolina. In other words, it is this: There is no legislation in South Carolina at all protecting the agricultural laborer, and the landlord class has been the most shortsighted of any class of people the world over. They have been content to use one of the three systems of farming that they have been using for years, to their great detriment and to the destruction of the fertility of their own soil.

Q. Are those the systems we heard enumerated here this morning?—A. Yes. There is not any law in South Carolina that fastens the landlord to his tenant or the tenant to his landlord, in morals. There is a law, however, that is very obnoxious to the tenant; that attempts to fasten the tenant to the landlord, which, in the end, drives the tenant away from the landlord.

Q. What is that law?—A. That law is this: All that is necessary for the landlord to do is to state, verbally sustained by two witnesses, that John Bingham has contracted to work for him that year, and if you hire him the law arrests you for hiring that man and makes you pay a penalty; hence they have gotten to believe that anything is better than a verbal contract on a farm.

Q. Does the lien law operate against the interest of the tenant?—A. The lien law, when honestly enforced, does not injure the tenant. But with the violations of the liens, handled in these little courts, that are not courts of record, the injustices done there under that lien law are so stupendous that it breaks the heart of the tenant, let him be white or black. It is my judgment that if the landlord wants to enrich and enhance the agricultural interests of the State of South Carolina, he should make every violation under the lien law controllable in the court of record and nowhere else; he should see that that law allowing verbal contracts and the prosecution following should be set aside. If he wants to enrich his soil he should at once ask the State of South Carolina to pass a landlord law encouraging long leases, and looking to reciprocity of landlord and tenant, saying to the negro tenant and to the white tenant, "if you will stay here 10 years your lease will not be increased, and if you will follow this I will not take it away and give it to John." Those are the rank evils that stand in the way of the prosperity of the farm. It is legislation, and not the meanness of the landlord to the tenant, or the tenant to the landlord, that has frightened the tenant into the cities. I would not say it if I did not want my people to see it and remedy it.

Q. Would you recommend the repeal of these laws?—A. I have done it repeatedly. Q. Let me ask you a question with reference to the lien laws as they are, in cases that have come under your observation in which the landlord, who, having a lien on the tenant's crop, refuses him the right of even taking some corn, some potatoes, or cabbage from the ground for his own use until that lien was satisfied?—A. The Southern planter or agricultural manager is not mean at heart. He will feed the thing he works, and to say that a negro has been starved, or anybody has been denied the right to take anything from the soil and use it—I have never known of a case. I think I have answered that, sir.

Q. Is the lien law ever used as a lever to continue a good tenant or dismiss a bad one?—A. Yes.

Q. In what respect?—A. For instance, I will show you: No man can leave his landlord if he is in debt, if the landlord wants him, because when he leaves he leaves everything. The lien law honestly and fairly is used as a lever to keep the tenants on the farms, because if a man has not paid and is good for anything the man who has the lien on it will not let him go. The lien does not only cover the crop, but invariably it covers all chattels that the tenant owns. Therefore, without insinuating that it is wrongly done, I tell you it is honestly done. On the other hand, if a man is under lien, and he is of no account and does not pay up, he has got to go.

Q. (By Mr. SMYTH.) You then would recommend the repeal of the lien law?—A. I would recommend the commission to recommend the repeal of the lien law.

Q. (By Mr. RATCHFORD.) Another question: In regard to the relations between the landlord and tenant; to what extent is the truck store—it is called truck store in the North, at least—used among the tenant agricultural classes.

The WITNESS. You mean by that the plantation stores?

Mr. RATCHFORD. Yes.—A. Nearly every planter who plants on shares or hires his labor has his commissary, either in his house or in the store in town, and the man who is planting on shares seldom gets any money, because his landlord can not get any, as a general thing; but he gets orders for what is in the storeroom from his landlord.

Q. In case the landlord gives him an order or supplies him with goods, his order is guaranteed by a lien on the crop, is it?—A. His order is guaranteed to his landlord.

Q. Secured, I should say, instead of guaranteed, by a lien on the crop?—A. On the general crop of the landlord and not on the special crop of the tenant.

Q. I did not catch that.—A. Most of the landlords themselves give liens in town for their supplies, and they sublet it out, you know.

Q. In case the tenant gets an order from the landlord for supplies, does it not follow that he has to secure that order by a lien upon his share of the crop?—A. That is it exactly, sir. Wherever a landlord has not capital enough of his own to run the land, he signs away his right as landlord and the first lien on the crop to the merchant who supplies him. Then the merchant is paid first, and what is left the landlord gets next, and what is left after that is divided between the landlord and tenant.

Q. Have you any special recommendation to make to take the place of the lien laws, or outside of general recommendations that you have already made?—A. Yes, if I have not yet spoken about long leases.

Q. Mutuality and reciprocity?—A. Yes; between landlord and tenant. A question was asked here about the responsibility of employers to the employees. There is no law in South Carolina, unless it is among the factories, that holds the employer responsible to the employee the year round.

(Testimony closed.)

CHARLOTTE, N. C., March 14, 1900.

TESTIMONY OF MR. GEORGE T. WINSTON,

President of the North Carolina College of Agriculture and Mechanic Arts.

The subcommission of the United States Industrial Commission met in the rooms of the Southern Manufacturers' Club at 10 a. m., Mr. Smyth presiding. Mr. George T. Winston was introduced as a witness at 11.52 a. m., and, being first duly sworn, testified as follows:

Q. (By Mr. SMYTH.) What is your name?—A. George T. Winston.

Q. What is your place of residence?—A. Raleigh, N. C.

Q. Your occupation?—A. President of the North Carolina College of Agriculture and Mechanic Arts.

Q. Will you give us a statement with reference to that institution, its size, scope of work, attendance, and where you receive your funds for running it?—A. The scope of work of the institution is to educate for civil engineering, mechanical engineering, electrical engineering, agriculture, and general scientific work. We have also made a beginning in textile education and we are making efforts now to put up a textile building in which we can give practical instruction. This building will be a model cotton-mill, equipped with machinery for spinning, weaving, dyeing, etc. At first we expect to confine ourselves to cotton, but afterwards to take in wool and possibly silk. The college is 10 years old. We began on the land-scrip money, supplemented by a State appropriation of \$15,000. The land-scrip income amounts at present to \$7,500 a year. That was given to the university of the State originally, but in response to quite a demand in the State for a separate institution, which it was thought would give more practical instruction than the university, this college was started, and the land-scrip money was transferred here. The present income of the college is from this fund and money under the supplemental Morrill Act, and a State appropriation of \$10,000 per year, together with fees from students. There is also an arrangement by which the college receives some benefit from the money given to experiment stations under the Hatch Act. That is to say, certain officers of the experiment station, agriculturists, chemists, and horticulturalists, receive part of their compensation from the funds of the college, and perform certain duties in the college as professors in the same chairs that they fill as officers in the experiment station. The college furnishes all the land and all the buildings and the equipment for the work of the experiment station, and a portion of the time of the officers of the experiment station is given to the work of the college. We seek to secure an equitable division of time and labor proportionate to the amounts paid from the experiment-station funds and the college funds.

Q. Are the pupils all white?—A. All white and all males. The rules of the college, however, admit females to the technical courses, or on special vote of the faculty to any other courses. We do not encourage females to come to the college without a definite purpose in coming. For instance, they will want to come to the textile school when we get that well inaugurated, and we hope they will come. They will be received there without any limitations at all. If any of them wish to come to study dairying, or to study horticulture, they will be received; but we will not receive generally, without a special vote, any female for a general higher education. Our reason for that is, first, that the State has provided another institution especially for females, and therefore they might as well go there, that institution being better adapted to them than ours; and, secondly, we prefer that this institution be managed for males, as the discipline and general management are easier. We have not dormitories and other accommodations for women. Our regulations amount to this: Females who are mature and have a definite purpose and know what they want are received into the college, but they are not encouraged to come generally, and, as a matter of fact, none have come and none are there now. The total enrollment of students this year is 293. The cost of education is very little at the college.

Q. What is the tuition fee?—A. Tuition is \$20 a year—nine months.

Q. What are the charges for board and uniform?—A. Board is \$8 a month.

Q. Do you restrict the attendance to residents of North Carolina?—A. No; we receive anybody. The uniform costs \$16; fuel and lights, \$12 a year. You see these charges are very small. There has been a tendency, owing to the cheapness of education at our college, for a good many to come there for that reason that really have not desired industrial or technical education. We are curing that; we are declining to receive any who do not take the regular courses. If a man comes to us who wants instruction in machinery, we will give him instruction in machinery and not compel him to take any instruction in books; but if he wants instruction in books, and not in machinery, we will not give it to him. We have rejected this year about 15 who desired literary courses and did not want technical instruction. In our freshman class we require every student, regardless of what course he is to take subsequently, whether he is to be an agriculturist, or a civil engineer, or a mechanical engineer, or an electrical engineer, or whatever he is to be—we require every student, in addition to his book studies, to do 12 hours a week of practical work in the carpenter shop, lathe room, and forge shop. Twelve hours is the total, including drawing and designing. In addition to this, we have 15 hours a week book work. As we go on higher in the course the amount of shop work is increased and is differentiated. A man who is to be a mechanical engineer goes into the machine shop; a man who is to be an agri-

culturist does not go into the machine shop unless he wishes to, and a man who is to be an electrical engineer will spend his time in the machine shop and in the electrical shop also. I can say in general that half the time of the first year is given to actual industrial work, and about three-fifths of the time of the subsequent years, including in that drawing and designing. We find the young men very responsive to this industrial training, and we find a very considerable demand for their services. We lose students all the time, very often as early as the sophomore class, who are called away to do work, even for architects, and in machine shops. We lost yesterday from the junior class a young man who goes to Atlanta to an architect's office. The demand is so great for trained workers that we lose annually some of our best men. I think it would be safe to say that if our equipment were ample, building accommodation and recitation rooms, teachers, etc., we should have 1,000 or 1,500 or 2,000 students as easily as we now have 300. The demand is so great in the State for this kind of instruction; but you see how small an appropriation the State gives—only \$10,000—and we have very slender accommodations.

Q. We had a great deal of testimony yesterday in reference to schools of this character, and the need of an appropriation for them from the Government. Would you favor a recommendation by this commission for an appropriation from the General Government in the aid of textile and manual schools, and also to the common schools, and if so, why?—A. Yes; I would. I thought that the Blair bill, when it was introduced, was a very wise measure. It was opposed, however, by most of the Representatives from the South. I think that legislation was very much needed by the South. Our public schools had not then, and have not now, developed to the point of efficiency. The mass of educated people of the South are not ardent supporters of the public schools, and the mass of uneducated people know so little about it that they are not ardent supporters of them. I say "ardent;" but agitation of various kinds is adding to the merit of the schools, and they are gradually pushing themselves forward; very slowly, though.

Q. How long do the public schools last each year in North Carolina?—A. Seventy-one days.

Q. (By Mr. C. J. HARRIS.) Is the general tendency—I was going to ask about the public schools, whether the tendency to prolong the terms from year to year in the public schools is increasing any?—A. Yes; it is increasing. The appropriation for the public schools has been increased by each successive legislature for the last 10 or 15 years.

Q. There has been a general tendency for the better all the while?—A. Yes; very decidedly. The schools are supported at present by a tax of 18 cents on the hundred dollars' worth of property, and a dollar and a half poll tax. In addition to that there was a lump appropriation by the last legislature of \$100,000, which is being distributed over the State. Of course the most efficient schools of the State are those in the towns and small cities. There they have a special tax.

Q. What do you say of the facilities for higher education in this State?—A. Considering the means at their command, the facilities are remarkably good. The amount of work that is done for the money would scarcely be credible to persons familiar with institutions like Princeton, and Harvard, and Yale. Take the University of North Carolina, with an income of not quite \$50,000. It is almost incredible that this institution should be able to train men who, on graduating, secure scholarships from Harvard and afterwards fellowships in competition with Harvard men. I say it is quite remarkable that the State should be able at so small an expenditure to furnish an institution that would train men so thoroughly and efficiently as that at a total of \$50,000.

Q. How many students do they have?—A. They have at the university now about 600.

Q. What is the number of colleges in this State?—A. About a dozen. They are mostly church colleges, all except the university and the State college that I have just spoken of—the agricultural and mechanical. The Presbyterians have an excellent college, Davidson College; the Baptists have a college at Wake Forest; the Methodists at Durham, Trinity College; the Christians have Elon College; the Quakers have Guilford College; the Lutherans have North Carolina College, Mount Pleasant; then there are a great many local colleges in the State.

Q. There are 3 or 4 colleges in this State of really high standing, are there not?—A. Well, yes. I judge that Wake Forest, Trinity, and Davidson would be the best of the smaller colleges.

Q. What I wanted to get at was, as I understand it, there are 3 or 4 colleges in this State that are really high?—A. Yes; I think so.

Q. Of collegiate standing?—A. Yes; I think you might speak of them as doing very creditable work.

Q. (By Mr. RATCHFORD.) Would you expect the Federal Government to aid those colleges?—A. No.

Q. Is their education confined to members of each particular denomination?—A. Well, practically, except local patronage; yes, practically.

Q. The Government aid you would expect would be for such colleges as were open to all classes and denominations?—A. Yes.

Q. And the public schools, also?—A. I do not expect any of it, but I think it would be well if we had it.

Q. The public schools also?—A. Yes; I think it would be well if help could be given the public schools.

Q. Some reasons were given yesterday by witnesses why the Federal Government should do this. What reasons would you advance in support of that position?—A. I would give two reasons, so far as the South is concerned. First, the unusual impoverishment of the South by the war, and the burdens resulting from the war. The South lost its entire slave property, and suffered a very considerable depreciation of all other values. It is beginning to rally from that, however, but while the South bears its share of the burdens of the Government, of course it gets no return, or but little, in pensions, for instance. The other reason would be the improvement of citizenship. I see no reason, in the nature of things, why education should any more be a State function than a national function. I think we should have a national university, for instance, at Washington, and just as the State of North Carolina is helping the weaker counties to pull up to the general level of education, so I should think there might be some system arranged whereby the United States would help the weaker sections or States in pulling up to the general national level of education; certainly national aid might be given in the direction of supplying teachers through subsidized normal schools, and in the direction of technical and industrial education. You would thereby lift up all the schools by promoting the education of teachers, and you would help industrial education in all lines. The supply of education for the professions is already ample. There is no trouble about that.

Q. Do you find that the standard of education among the people generally in your State is increasing as compared with 10 or 20 years ago?—A. Yes; very decidedly.

Q. The responsibility is also increasing?—A. Yes.

Q. In the average citizen. The cause of this increased responsibility comes from the increased demand for education?—A. Yes. We should have a more general improvement among the mass of our people if they had more education. Therefore, I favor compulsory education as the greatest leverage to improving the condition of our Southern people. I think it would work in two directions. First, I think it would make them discontented with their present lot. If every boy and girl in North Carolina could go to school 6 months a year for 5 years, he would not go back home and live in the same house and eat the same food that he will live in and will eat without any education. Take the negro, for instance. One of the greatest drawbacks to the progress of the negro is his satisfaction with so little. That which we look upon as a rather sorry quality of the negro is really the one which is doing most at present for his improvement; that is to say, his vanity. He is exceedingly fond of good clothes and making a show. Of course, I speak of the negro as a class, not individually. If it were not for this quality I do not believe the negro would do half as much work as he now does. The desire of the negro girl and the negro boy for fine clothes is, I believe, the greatest present stimulus which is making them do any labor beyond the labor just necessary for a mere existence. In the same way in many directions, universal education applied to the white race would increase wants and desires, and it would also gradually stimulate their intellectual activities and make them capable of doing more things and doing them better. So that, as an economical measure, not merely as a social, philanthropic measure, if I wanted to increase to the greatest degree the productive power of North Carolina, I should favor, first, universal education, compulsory as much as possible, and, second, as much industrial and technical education as possible, putting it into the public-school system, drawing and designing, carpentry, and such like things as they have in the New England States, and culminating in the greatest possible number of technical schools.

Q. Did the lack of education among the colored race in the South serve to check the progress of the people of the South generally as much before emancipation as it has since?—A. Slavery entirely checked the industrial progress of the South.

Q. (By Mr. C. J. HARRIS.) What would you say as to agriculture?—A. It checked the industrial progress of the South in every direction. If slavery had continued until now, in my opinion the South would be utterly and irretrievably

bankrupt to-day. The South was fairly prosperous with black labor until the settlement of the Mississippi Valley, the West, the Northwest, and the Southwest. But since the development of these portions of the country with much more fertile land than we have in the South, we are utterly unable, in my opinion, to compete in the markets of the world with any staple crops raised by ignorant labor, excepting possibly cotton and sugar.

Q. (By Mr. RATCHFORD.) My inquiry was in regard to education rather than slavery. The point I wish to bring out is this, Was the illiteracy of the colored race as great a check to progress prior to emancipation of the colored men as it is now?

The WITNESS. To whose progress?

Mr. RATCHFORD. The progress of the whole people of the South.

The WITNESS. What sort of progress?

Mr. RATCHFORD. Industrial progress.—A. The illiteracy of the negro, in the way you put it, I do not think had much to do with it. The presence of the negro as a workman, and as practically the only laborer in the South in slave time, prevented the white man from being a laborer, so that we had no skilled labor of the highest order in the South; there was not any in North Carolina, certainly. I do not include in that carpenters, brick masons, plasterers, and that kind of labor, but I mean machinists of any kind, engineers, architects. I attribute that to the fact that the laborer in the South was a slave, and from the nature of the case he could not reach the highest skill; and the white man did not enter into the field of labor at all, because it was occupied by a slave, and labor was disreputable. So the presence of the negro as a slave in the South not only interfered with but absolutely prevented the development of industries to a high degree in any direction, except the very rudest and crudest, those which could be performed by the negro himself.

Q. With the emancipation of this low class of labor, then, came the duties of citizenship?—A. Yes.

Q. Have the colored people since been able to discharge those duties in such a way as to promote the interest of the people of the South in any marked degree?—A. No; they have hindered the interest of the South very decidedly, and in that I include their own interests.

Q. By that you mean they were not ready for the duties that were thrust upon them?—A. They were not at all ready; and an evil was created by their enfranchisement that for a full generation has threatened to destroy the South. There is now pending in North Carolina an amendment to the constitution which is intended to remove this evil. If I were a negro I would vote for it; I should consider it best for my own race.

Q. What is the amendment?—A. It is an amendment imposing an educational qualification for suffrage.

Q. Upon all races?—A. Upon all; but excepting from its operation until 1908 the descendants of such persons as could vote on the 1st of January, 1867. In other words, there is a practical exception until 1908 of those whites in the State, except foreigners, who may be illiterate. There is an exception of those negroes in the State whose ancestors could vote in 1867 in any State of the Union, but not any of those who resided in the States where they could not vote. Speaking generally, there will be an exclusion of illiterate blacks from the suffrage from now on. There will be an exclusion of illiterate whites also from the suffrage beginning practically in 1908. There is a temporary permit, not to all the illiterate whites, but the effect will be to permit the majority of illiterate whites to vote up to 1908. If I were a negro I would vote for the amendment. The real problem with the negro in the South is to make a living. He should seek industrial opportunity; that is his real problem. He has no political chance, and he has found that out; he can not have any political chance. It would be a miracle if he could have, with his antecedents and with the race he is competing with. He himself has sense enough to know that he has no political chance. There are people who are not in contact with him or the Southern whites who have not yet found it out; but the negro here knows it, and any intelligent negro in the State will tell you so. The real struggle for the negro is to fit himself for the industrial fight that always exists—the fight to make a living. He had better fit himself for it in this generation. If he does not the white man will entirely occupy the field; and if he does, the negro will never get into it, because he can not travel as fast as the white man. That was the negro's opportunity when he was emancipated, if he had not gone off into politics and all that sort of thing. If the whole race had set themselves right steadily toward the acquisition of property, they would have had a chance at least to win. I do not know what the result would have been. The problem is still before us. If they do not begin to train

themselves to be carpenters, blacksmiths, masons, plasterers, and handicraftsmen generally; if they do not quit educating themselves for law and medicine, preaching and teaching, and turn their best talent into industrial lines, then they have no chance in the world here. In my opinion, therefore, it would be better for the negro race if the public schools throughout the State were turned into industrial training establishments. I think if all the money that is now given to every single public school in Mecklenburg County was put into industrial schools for Mecklenburg County, it would be better for the race than the way it now is.

Q. (By Mr. SMYTH.) You think, then, what Booker Washington is undertaking to do is on the right line?—A. Exactly; so far as the condition of the negro—

Q. (By Mr. C. J. HARRIS, interrupting.) Do I understand you to say that you are not in favor of teaching the negro race to read and write—the rudiments of education?—A. No, sir; I do not take that position; but as between that—

Q. (Interrupting.) But would not your scheme necessarily result in that?—A. For a while, yes. As between the choice of two things, I say the other thing is better. Do not misunderstand me, please.

Q. (By Mr. RATCHFORD.) If both can be combined, they are better still?—A. That is right, sir; if both can be combined they are better still, but not with the means we have here.

Q. (By Mr. SMYTH.) You think it is impossible to combine both at present?—A. Yes, for lack of means.

Q. And therefore you recommend industrial in preference to academic training?—A. Yes. I suppose that three-fourths of the houses east of Raleigh up to 1860 were erected by negro workmen. My father owned a couple of carpenters and a very skillful barrel maker, a man who would earn \$2.50 a day, a colored, black negro; also a couple of shoemakers, and a tanner. I doubt if the children of any of those skilled laborers that my father owned have any skill in any trade at all.

Q. (By Mr. RATCHFORD.) Were they trained or did they make themselves mechanics?—A. Partly by themselves and partly by the owners recognizing this talent and having it trained under the apprentice system of hiring out.

I think the race is doing the best it can under the circumstances—the very best. I am not pessimistic at all about it. I believe all problems connected with it are going to solve themselves. I believe the condition of the negro is better than it was in slavery, but not as much better as some people think. In slavery there were practically only two classes of negroes, and now there are three classes. In slavery there was the best class, the most intelligent, skilled workers and household servants, and then the great mass. Now there are three classes. There are the most intelligent ones, who are mainly professional men, or barbers, or something like that, and then there is the great mass, and then the lowest class. There was not any lowest class in slavery. The lowest class now is composed of the professional thieves and gamblers and petty criminals, loafers, vagabonds, prostitutes, general idlers, and vicious. I say that class did not exist in slavery. You may also add to the lowest class the infirm, decrepit, invalids, and semi-idiotic. Those are not taken care of now. The worst cases, of course, go into the State institutions. Under the slave system the whole establishment was taken care of. Under the present system the idle and vicious and weak are driven to the wall, and are driven into bad habits. The best class is rather larger than it was in slavery; the lowest class did not exist in slavery, and is getting rather larger every day. The great mass of negroes in some places are better off than in slavery, in some places about the same, and in some places worse off. I think on the whole the race is in better condition than in slavery. If something could be done to restore the friendly relations between the two races of the South, and to give them industrial education, it would, in my opinion, do more for the negro than anything else that could be done.

Q. Have you anything to suggest on that line—the restoration of those relations?—A. I think it will depend upon two things—first, the elimination of the great mass of the negroes from political life, and, second, the demonstration by the negro that he is fit for higher industrial education and can make himself useful and indispensable as a laborer. Whenever he shows that, he will have plenty of strong friends, if he does not keep up that antagonism which he now feels toward the white race. For example, when I was a child I used to say my Sunday-school lesson along with the negro children of my age. We were all called up and catechized, and some of the negroes knew their lessons as well as I did—perhaps better. At night, in my mother's bedroom, slept one or two negro girls who were house servants. She was interested in their morality and in their cleanliness; she made them wash and keep clean and dress decently. They spent

their lives practically in the house. They heard all the conversation of the family. My father was a lawyer and we were all educated, and the negroes were benefited by the free association with us. They had to come into the house at a certain hour and go to sleep. They slept by my mother's bed, and she took an interest in their entire moral and physical, and to some extent their intellectual, welfare. That is hardly the case to-day anywhere in the South; it was the general rule before. That is what I mean by "restoration of kindly relations." A negro girl to-day who is a house servant desires it understood that she is not to sleep in the house where she is a servant. If the lady who is employing her should undertake to say anything about her sleeping, going and coming, she would bitterly resent it, and, worse than that, her father and mother would resent it. In other words, they have cut loose from the influence which comes from the kindly social contact between the employer and employee, which was a very close one in the South under the slave system. The negro parents are unable to exercise the control which they should exercise over their own children, and they have cut loose from the control formerly exercised over the children. The negro children of this generation are practically without any control. I speak of the masses; I do not speak of the higher class.

Q. Is it your opinion that association of the large mass of negroes with the white population will ultimately tend to raise the standard and improve their habits?—A. Yes; I think it would; very decidedly.

Q. (By Mr. SMYTH.) The criminal class among the colored people is recruited very largely from the younger generation?—A. Very largely.

Q. (By Mr. C. J. HARRIS.) Did I understand you to say that you thought the negro could be eliminated from voting and all political rights?—A. I think it would be best for him. He is practically eliminated anyhow.

Q. (By Mr. SMYTH.) That would remove the social friction between the two races?—A. Yes; certainly, that would remove it. If the negroes had not been given the suffrage when they were given it, the kindly feeling which then existed and was very strong between the races, in my opinion, would have continued, and the white people who owned slaves would still have employed them, and would have been interested in them personally, not merely as laborers. They are not interested in them now.

Q. (By Mr. C. J. HARRIS.) They are eliminated here in the South. Why not everywhere?—A. Well, it is just like the Chinese question, or the Indian question. You might ask that question in California—why the Chinese should be eliminated in California and not in Massachusetts.

Q. (By Mr. RATCHFORD.) Without going into partisan politics, will you explain how and to what extent the colored man is eliminated from the exercise of his political rights?—A. A good illustration is South Carolina where there are two negroes to one white, and yet the white people govern the State.

Q. It does not necessarily follow, does it, that where the colored men are in the majority they vote as a unit?—A. Of course it is well understood that the negroes as a mass vote the Republican ticket in the South. It is like the revolution that was in Hawaii; there were about 5,000 Americans and English people in Hawaii, and they walked out one morning, pulled down the Hawaiian flag and put up the American flag, and said to the other 200,000 people on that island, "If you can pull down that flag, come and do it." Well, it is the same crowd of folks down South as did that in Hawaii.

Q. You have reason to believe the votes are received and counted, have you, on election day?—A. I do not know. I have never been a ballot holder, and have no knowledge of that business. I simply say this, that wherever the white race comes in contact with an inferior race in any mass, so that it can threaten to be a controlling element in political life, the white race predominates. Take the Chinese in California and the Indians out West. We let Indians vote in North Carolina, but they are not allowed to vote in those States where their voting would make any difference—in the West, for instance. We might ask why these fellows out West disfranchise the Indians. We do not disfranchise them.

Q. (By Mr. C. J. HARRIS.) That is in the treaty made with them here.—A. Why did we make that treaty?

Q. The local status here.—A. Why is there a different local status? The reason is it don't make any difference here and it would make some difference somewhere else. It is the same reason why the Chinamen vote in Massachusetts and can not vote in California; the same reason exactly. The negro has political rights in the North, but don't have in North Carolina. The negro has the same rights in Massachusetts as in California, but the Chinaman does not. In the State of Washington an Indian don't have any; in Hawaii the negro don't have, and so on all the way around the world. There is nothing peculiar about

this question, nothing whatever. It is simply complicated and mixed up by feelings engendered by the civil war between the white man in our North and South, so the fellow up North would not see this negro question as he sees the Chinese and Indian question. He has the meanest kind of feeling for the Indian; he has kicked him off the face of the earth; has got his lands, and won't let him off until he has wiped him out of existence. There are only 300,000 of them on our continent. He passed laws excluding the Chinaman from the continent. Nobody would maintain for a moment that the Chinese are not a superior race to the negro.

Q. (By Mr. RATCHFORD.) That they were not a superior race?—A. Certainly; nobody would maintain it. Look at their literacy; look at their civilization; look at their industrious habits, and yet they are excluded from the whole continent. You heard a gentleman from South Carolina this morning say that he did not want the negro pushed out—wanted him to stay here. As to that matter, I yield to no man as to my kindly feelings. I played with them, stayed with them, hugged them and kissed them, and I have slept with negroes 50 times. It was the very height of my ambition and joy to go out to a negro cabin and play with them. The most pitiful story in the history of our country, perhaps in any country, is the putting up of the negro to a position in conflict with this branch of the white race and expecting him to maintain himself. It is one of the saddest things that ever happened in history. As a friend to the negro, I say that his real friend, wherever he belongs, whether North or South, will desire to put him, as soon as possible and as systematically as possible, in a course of industrial training to enable him to make a living in the world and get property and be somebody, and will entirely remove from his head any idea that he is to furnish Congressmen and governors, legislators, justices of the peace, trustees, and other officials to manage the white race. Those ideas have put him in such a state of hostility to the white race as has tended to destroy all of these kindly influences which existed during slavery in the daily relations of life.

Q. (By Mr. C. J. HARRIS.) Would you give him some citizen's rights?—A. Certainly; give him all the protection the law gives any man.

Q. (By Mr. SMYTH.) Give him full right to own property and acquire property?—A. Why, certainly; and let him enjoy all political rights as long as he shows himself capable of exercising them properly. He did enjoy political rights in this State up to 1835. My grandmother went to school with negroes. One of the best teachers of Orange County was a negro. He taught Wiley P. Mangum, one of our most eminent men. He taught half a dozen of the most eminent men the State ever produced. He was a negro Presbyterian teacher. These kindly relations can not be restored with constant political warfare between the races. Here is where the trouble is coming to in the South with the negro. We have not had any trouble yet with the negro. It has not begun. The race question will come when the laboring white class won't want the negro to have an opportunity to labor. That is where the race question will be in the South. That is the race question you have in the North. You know that in New York City the white carpenters and brick masons and plasterers will not let a negro be a carpenter, bricklayer, or plasterer. The negro has lost that in the North; he can not do those things in the Northern States. The time will come when he can not do those things in the South, because, while we have a kindly feeling, we are no different from what you are. We are getting to be as selfish as you are. That has already happened in certain places in the South. There are numbers of counties in Texas that they do not even let the negro live in. He can not even plow. He gets \$15 a month for plowing, and the white man wants the job. In North Carolina he gets \$5 a month for plowing. The problem, therefore, I say, is for the negro to train himself to do this skilled labor and then do it before the hostility is so great between him and the white man that he won't let him do it; for then you will see a race question that will be one sure enough. There will be fighting and fussing enough when that comes, and all this political muss isn't anything compared to it. We are trying to promote that in this State; we are trying to give the negro the best chance possible for industrial education. There is a college in the State, supported by the State, for the industrial education of the negroes; simply an equal division of the funds which we have from the National Government (I mean per capita) between the college of which I am president and the negro Agricultural and Mechanical College.

Q. (By Mr. J. C. HARRIS.) Have you any further statement to make?—A. No, unless you wish to hear more particularly about the different colleges.

Q. (By Mr. RATCHFORD.) We would be glad to hear anything further that you have to say.—A. I will say one other word about this. I am glad to see these cotton mills starting; and if the negro shows that he is a capable laborer in the

cotton mill, you will see him employed on a large scale throughout the South by capitalists.

Q. (By Mr. SMYTH.) Is it your opinion that he is capable?—A. I do not know. I have no means of judging.

Q. You know of no reason why he should not be?—A. I think experience is rather against the probability of his being capable, but of course that is not worth anything in the face of the experiment now being made. This is a plain practical setting before you of what I mean by the labor struggle between the races: If this mill up at Concord, which I hope will succeed, does succeed, and other mills in the South employ negro labor, then if the white laborers strike in the white mills, and they employ negro laborers in their stead, you will see the same kind of trouble in the Southern States that you have seen in Illinois where white miners struck and negroes were brought in. I know you will see it if this is delayed very much longer. If the negro could have been employed in the mills immediately after the war, before the white people got into them, you would not have seen this trouble.

Q. (By Mr. RATCHFORD.) Even if it is not delayed, does it not seem as if one race would eventually crowd the other out of that particular labor market?—A. I think so.

Q. Do you think the negro is best adapted to follow these pursuits, generally speaking?—A. What pursuits?

Q. Agriculture and labor in general.—A. No, sir; I do not think he is. I do not share the belief that the negro is a better laborer in the South than the white man. I think the white man is a better laborer than the negro in anything he goes at.

Q. Have you any hope that the mixing of the races will eventually result in a closer affiliation between them?—A. Amalgamation?

Q. Amalgamation; yes.—A. No; I do not think it will. I have given a great deal of study to that, but I do not think it. There has been a great deal of amalgamation. The last census showed nearly 1,000,000 people in the United States who were half white and the other half either negro, Indian, or something else, but the next generation reverts to negro instead of becoming whiter. The quad-room and octoroon are either infertile with whites or their issue is sickly.

Q. For instance, many of the labor organizations that formerly excluded the negro from membership now accept him, and provide in their constitution that no discrimination shall be practiced by their members against any member because of his creed, color, or nationality. Do you look on that as a hopeful sign?—A. Yes; but these labor organizations doubtless are where there are very few negro laborers, and there is not the same reason for prejudice there as there would be where there are a great many negro laborers. It is the old question of the Chinaman and Indian. There is no prejudice in this State against the Chinaman or Indian. They could stop in any hotel in Charlotte; but a negro could not.

I do not want to leave a wrong impression with the commission. My father was a slaveholder, and I was raised with negroes, and have the kindest feeling toward them. I was educated in the North; I had two negro classmates; I did not any more mind sitting and reciting with them than with the white boys; I have none of that personal feeling—not a particle—but I make no distinction whatever in my mind between the negro and any other race which our race is competing with. I do not think there is any magic in the negro race because they have been in slavery. It is just like any other—the Chinese, Japanese, Indians, Spaniards, Frenchmen, Italians, or any other race we come in contact with. There is no magic in the word negro. He will stand simply and absolutely on his merits, and the Southern white people are willing to let him do so.

Look at the negro in Africa. England has just gone to war in South Africa because Englishmen in a foreign country were not accorded the same rights as the Boers—we are of the same blood as the Englishman—nobody is talking about the poor negroes who owned the land in South Africa, the poor negroes that the Boers have kicked out of their country; nobody is saying anything for them. That is the attitude of the world toward negro Africa.

There is no magic about the thing. We are going to do the best we can for and with the negroes in the South, but that "best" is not going to include their directing public affairs. I say that after being educated in the North and not being cantankerous in any manner, shape, or form, I am in favor of giving the negro every particle of education he will receive—literary, scientific, industrial, and every other kind—and giving him every single right of citizenship that he can and will exercise properly, and I do not mean by that voting the Democratic ticket; I mean voting any ticket he wants to, intelligently and with some reason.

(Testimony closed.)

CHICAGO, ILL., March 27, 1900.

TESTIMONY OF PROF. EUGENE DAVENPORT.*Dean of the College of Agriculture, and director of the agricultural experiment station, University of Illinois.*

The special subcommission met at 7.15 p. m., March 27, 1900, in the Auditorium Hotel, Chicago, Mr. Clarke presiding. At 8.35 p. m. Prof. Eugene Davenport, of Urbana, Ill., was sworn as a witness, and testified as follows:

Q. (By Mr. A. L. HARRIS.) Have you given the subject of adulteration of foods any thought or investigation?—A. I have not studied the adulterations of foods, but I have given some study to the question of food adulteration in comparison with such subjects as fertilizer adulterations and seed adulterations.

Q. Then you may go on and state anything along the line of adulteration you have in mind that will bear on the question.—A. It seems to me the further we keep away from the word “adulteration” in our legislation the better we are off.

It is a very difficult word to define, especially in a law. If we draw the lines hard and fast, we will cast odium and disgrace upon many things which are themselves entirely respectable, so that I should say that in theory, at least, legislation should aim to get at and make known the actual composition of these materials, rather than to determine the question as to whether they are adulterated and as to what is adulteration. The fertilizer business of this country as conducted now, it seems to me, furnishes valuable information along this line. There are thousands of brands of fertilizer. Nobody cares what the name is. The simple question is, How much nitrogen, how much phosphoric acid, how much potash per ton, and the amount must be guaranteed by the manufacturer, and the buyer buys it for so much nitrogen, so much potash, and so much phosphoric acid. In most of the States if he is deceived as to the amount the manufacturer or the dealer, one or the other, or both, can be prosecuted.

In the question of seed adulteration—to use the word again—in some cases rock is ground and mixed with clover seed and turnip seed—seeds that are small—where the adulteration can not easily be detected by the naked eye. Suppose we say that is an adulteration? What shall we say about a seed that is put upon the market exactly as grown upon the field, has no rock in it, but it is full of weed seeds? I should prefer to have my seeds adulterated with rock rather than have a large percentage of narrow-leaf plantain and the other seeds that live with clover; almost impossible to disassociate or separate them from it.

Q. (By Mr. CLARKE.) Are such seeds usually sold by weight or by measure?—A. Usually by weight. In case of a bad weight of course the damage is not from the lessened amount of seed that the purchaser receives for his money, but from the seeding that he makes upon his farm of the weed that is difficult to eradicate—much the same as paying for one variety of apple and getting another. I have been led to believe that the whole question is a broader one than the question of adulteration. It is just as pressing a question among buyers of fruit trees that they may know that the variety they buy is true to name and that they shall not, 10 years after setting out a tree and cultivating it, find that after all it is an inferior thing. It seems to me that it is hardly worth while to forbid the making of this or that compound upon the score that it is deleterious to health, because it is so difficult to say what is deleterious and what is not.

I know it is said that if we compel the publication of the composition of these food stuffs then we shall require manufacturers to publish trade secrets. I do not see why we can not protect a manufacturer in a trade secret by a patent just as well as we can the maker of a machine whose secret is known to everybody.

The whole question of the adulteration of milk is settling itself very rapidly, in some places, at least, by standardizing milk. I do not care whether I am getting watered milk, or skimmed milk, or milk made from a cow that could not produce anything but a low-grade milk; but I am interested in knowing that I get a certain percentage of cream in my milk. If the cow is not able to put more than 3 per cent of cream in that milk, the manufacturer should make it 4 per cent, if that is the standard he sells. In other words, the question is not whether he is selling skimmed milk or whole milk, but whether he is selling 3 per cent, 4 per cent, or 5 per cent milk. He can make it anything he pleases. If a man's cows give 5 per cent cream, he is entirely justified in putting in enough skimmed milk to bring it down to 4 per cent cream, if he is selling 4 per cent milk. The simple question is, What is the composition of the article?

A good deal of damage is done, it seems to me, in attaching odium to a very healthful article and increasing its price cost to poor people. A few years ago this

country was flooded with good things said about corn meal—all the products of indian corn—until it occurred to somebody to use it as an adulterant for flour, and from that moment on we heard hard things said about corn and adulterated mixtures of corn flour and white flour. It has lost caste. Certainly corn is as healthful as it ever was, and the mixture is as good as either one alone and cheaper than white flour, but nobody wants to buy it when he undertakes to get high-class wheat flour. After all, does not the offense consist in professing to sell one article and actually delivering another? That is about the line I had in mind about this.

Q. (By Mr. A. L. HARRIS.) Admitting that mixtures exist, what remedy have you to suggest in the way of legislation?—A. Simply this, that I have already mentioned: that the actual composition of the article shall be known; that it shall be published by the one that offers it for sale, exactly as it is done now in most States with fertilizers, and exactly as a great many dealers are doing voluntarily now with stock foods. For example, the Chicago Glucose Company finds that its refuse products, like gluten meal, are very valuable stock food. Voluntarily they are putting the analysis of these foods upon their sacks; it is to their advantage to do it. I do not see why other people could not also be compelled to do it.

Q. Are you acquainted with the legislation that Illinois has just had upon that subject?—A. Somewhat.

Q. Along what line is the recent legislation?—A. The recent legislation is aimed largely at the question of adulteration and at the willful nonobservance of the law. Personally, I do not think that the willful element ought to enter into it at all.

Q. Are you favorable to national legislation on the subject?—A. I have not given that subject study enough so that my opinion would be worth much as to the need of national legislation. There are difficulties bound to arise as long as it stays within the realms of State legislation. As long as there is no uniform law these companies will make one brand for one State and another for another; but as to whether we will get ahead faster in that direction or through national legislation I am unable to say. I do believe, however, that as long as the law is aimed at adulteration the less we have of it the better, State or national.

Q. Where the article may be of interstate commerce, would State legislation be sufficient?—A. I could not say as to that. I do not consider myself informed on that point.

Miss SICKELS. One very important feature has been touched upon by the different witnesses this evening, and that is the necessity that the consumer, the general public, should be so instructed in the foods they purchase that even though they are labeled they may know the right kinds and know how to select them; and it was with an idea of learning the instruction which is now being given in the universities and undertaken and contemplated that Professor Davenport's testimony has been sought; his experience is so extensive as to make him better qualified to show the line of education contemplated in our colleges.

Q. (By Mr. A. L. HARRIS.) You have heard the statement made by Miss Sickels. Can you give the commission any information along that line?—A. Upon that point I am glad to say that I feel that in our early legislation upon this subject we have attempted to mix education with regulation of commercial matters. It will be noticed that I have not recommended that legislation prohibit the sale of anything. That means that the buyer must inform himself as to what will be the consequence of using this or that food or drink, whatever it may be; and I mean by that that the public will inform itself upon food questions. We can not expect that the laws will say to us what we must or what we must not eat. The individual must study the food question. This will be studied by him from the nutritional standpoint, and the standpoint of hygiene, and the standpoint of the proportion of nutrients. It is the only reliable guide to the intelligent use of food, because the law can not prescribe what kind of food shall be taken and how much of it. Each individual must settle this for himself or for herself day by day, and the only intelligent solution of this side of it—what shall be bought and consumed—lies in the higher education of the individual who is to buy and consume it. The law can not undertake to provide this except by the medium of education. It can undertake to furnish that individual with definite knowledge. I believe it can. I think it ought to.

With the study of foods the human animal will know better than he does now what he ought to eat. I am bound to say that we know a great deal more about stock food than we do about human dietaries. That is because there is money in it. I think all will agree with me that careful studies of animal nutrition—stock feeding in general—were made a good many years before corresponding studies

were made of human dietaries. There is this difference in the two: In feeding an animal, first for its development and second from the standpoint of economy—to make as cheap meat or cheap milk as possible—the whole thing is a money question, while we feed ourselves largely to tickle our palates; and in this country, at least, human food is largely a matter of luxury. The bulk of the cost of our foods is to tickle our palates, of course feeding ourselves upon an entirely different plan than we do animals.

As we are establishing these schools of domestic science—I do not think that is the proper term, but the proper term has not yet been invented—very much more knowledge of foods and their effects will percolate among the people. In the earlier days of the study of these questions an abnormal, or perhaps I had better say an undue, interest was attached to the hygienic side of the thing, the deleterious effects of certain things having been magnified until the very idea of food investigation or the study of foods in the minds of a great many is a study of narcotics or stimulants or some deleterious effect of what is taken as a drink. What we want is an exhaustive study of normal food stuffs—the normal nutrition of the normal body in health. That is what it is designed to do in these schools of domestic science. So far as I am acquainted with them, every one of them is successful—successful in that they are attracting attention among students to take the studies; and they do succeed in learning more about foods and their preparation.

Q. Are you giving information along that line in the Agricultural College of Illinois?—A. We are not at present. It has been a number of years since there has been a department of the domestic sciences, until the last meeting of the board of trustees, when a department was established which will be opened in September next.

Q. Your State has made an appropriation for that purpose?—A. No; it has not.

Q. Does the State appropriate to support the Agricultural College of Illinois?—A. It has made some special appropriations in support of the College of Agriculture, but only in a minor degree. The College of Agriculture in this State is supported with the funds received and, arising from the General Government from the land grant of 1862 and the second Morrill bill of 1890.

Q. This State gives the college no help?—A. Of course the buildings erected for the College of Agriculture have been built with money from State appropriations. There is building now upon the campus a building for the College of Agriculture that will cost \$150,000.

Q. Has the object for which the National Government made the grant to this State been departed from in Illinois?—A. It is a very difficult question to answer, because it is a question of definition. The general assembly, at its last session, enacted that one-half of the funds received from these two Government grants that I have mentioned (the land grant act of 1862 and the second Morrill bill of 1890) should be devoted to instruction in technical agriculture as distinguished from the sciences that related to it, and as distinguished from collateral subjects. It is the first State to take that step. Knowing of colleges of agriculture somewhat over the United States, I should say there is a vast difference in the operation of these Government acts for the benefit of agriculture and mechanic arts as operating in the various States.

Q. (By Mr. CLARKE.) Are you familiar with the national legislation for the land-grant colleges?—A. Slightly so; yes.

Q. Are the land-grant colleges all chartered by the several States?—A. Why the several States accepted the grants formally and established the colleges as State institutions, if that is the question.

Q. They all exist under separate State charters?—A. Separate State charters, so far as I know.

Q. Have you examined the question as to how far Congress would have jurisdiction to prescribe the curriculum in these colleges?—A. The act of 1832 expressly stated that the subjects taught should be such as were determined by the State legislature—words to that effect. They did not prescribe the studies.

Q. Then, is there any need or any room for national legislation on this subject?—A. It is a significant fact that when the agricultural experiment bill, known as the Hatch Act, was passed, in 1887, the Government took measures to secure a good deal more minute information as to the operation of that law than it had taken as to the operation of the grant of 1862. Much more definite reports were made, and there has been much less difference of opinion as to the administration of that fund than there has been as to the administration of the other funds. Personally, I think the most serious consequences have come because there has been so little Government knowledge of the use of these funds for the benefit of these two subjects.

Q. Have the several State legislatures prescribed courses of study in these colleges, or have they left that entirely to the boards of trustees?—A. So far as I know it has been left to the boards of trustees.

Q. Their charters, then, probably confer on the boards of trustees full authority over that subject?—A. I suppose so. I have not examined them definitely, but I have never known of a case of the legislature prescribing the course of study for one of these colleges.

Q. Then if this commission had any recommendations to make to the several States on this subject, we would have to make a study of these charters to determine whether to recommend to the legislature or the boards of trustees, should we not?—A. I suppose so. I do not now recall the wording of the Morrill Act of 1890 as to how much control the Government exercises over the distribution of these funds. It reads "for the further endowment" of these colleges, though the wording is much more closely drawn in the second act than in the first. It is not too much to say that the general public who thought about it at all, and who had any interest in agriculture or the mechanic arts, either one, felt for many years that these grants, and especially the first one, had done very little good to agriculture or mechanic arts.

There were few students of agriculture, and, being few, it was said that they needed but little support, and it was many years before the subject of agriculture was really developed. You will find colleges now in the United States with only one or two men teaching the whole subject of agriculture, and you will find others where only one or two teach the subject of mechanic arts, as against a large number of teachers of the ordinary studies of college courses. One of the most prominent agricultural colleges in the country, founded before these acts but accepting their benefits, had no mechanical instruction whatever for more than 20 years after the land-grant act was passed.

Q. You recognize that the successful practice of agriculture requires more and more knowledge of certain sciences, do you not?—A. It requires more and more knowledge of itself. We need men who shall study agriculture in its various phases with a scientific spirit. It needs a development of its own. We used to have one man teaching agriculture in the college, and plenty of botanists and chemists and other scientific people working at the problem from the outside, but we never got ahead much with agriculture until we divided the subject, leaving one man to follow out this line and another that. There is no more similarity between the dairying industry and horticulture than there is between agriculture, horticulture, and mechanical engineering; not the least.

Q. When a farmer is engaged in what is known as mixed agriculture, carrying on quite a variety of things—agriculture, horticulture, and dairying—he needs to have scientific knowledge of the chemical nature of soils, of the fertilizers which he uses, of the food crop which he grows for his cattle, and of the changes which these crops undergo by processes of preservation, does he not?—A. Oh, yes; and a good deal more than that. The chemical composition of productive soils is of very little consequence as compared with other considerations. Some farms, fertile lands in a word, are chemically poor—would not show by chemical analyses any large amount of fertility; other lands that are only fairly productive are by the chemist's examination abundantly supplied with food material. It is not only a question of the composition of the soil, it is a question of its physical condition. It is a question of moisture. It is a question of rotation of crops. It is a question of the effect of one crop on another. In other words it is a science, or rather a number of sciences, within the subject itself. The whole question of soil biology or the bacterial life of the soil is a subject that never has been touched and never will be touched except by the agriculturalists.

Q. (By Mr. KENNEDY.) You see room, opportunity, and need for these land-grant colleges as institutions to benefit practical farming?—A. Yes; and I see need of still further development of the subject of agriculture, and that in the establishment of these colleges and in their conduct we should not have in mind so much the number of students that are to be taught in a given year as the character of the subject that is being developed. One man may teach a hundred students if the subject is simple enough, but if the subject is very complex there must be 10 men teaching. The progress that is being made now is being made by minute division of this subject, in which one man takes cattle, another man takes horses, another man takes crops, another man soils, and so on down. We have 11 men in the University of Illinois who teach nothing but agriculture—some phase of it; no two of them teach the same subject. There are less than half a dozen institutions in America organized on that basis. In most cases one or two, at most three or four, men attempt to teach the whole subject. They do not go far enough into it to really develop the science of agriculture. It is very unfortunate indeed

that these States have not as a rule recognized the fact that these funds should have been used to develop these two great subjects rather than used to give instruction to a given number of students.

Now I want to say in connection with that that boards of trustees are to be sympathized with in this whole matter. Agricultural people have been inclined to criticise the management of these State institutions for agriculture and mechanic arts, not stopping to think that when a college is organized it is vastly easier to secure students on well recognized lines of instruction like English, mathematics, and history—these things that have been taught for many generations—than it is to secure students on a new subject.

Now, boards of control are always pressed for funds; they need more money than they can get. All the States have helped out these funds—I say all of them; I think nearly if not all—have made additions to these Government appropriations. I presume there is not a board of control in America, that there has never been a board of control, that was not pressed for funds at any given time. It is almost necessary to put the funds where the students go; put the support where the call is. If one department has few students and another is overrun with students, then the money goes there of necessity, and it is defensible by saying that the people of this State want this, but they do not want that; and they please the legislature and meet the demand the best they can. These things fatten on what they feed, and after a time it has happened in some places that agriculture has been almost entirely crowded out—lost to view. The less support it had the fewer students it drew; until I have known of many cases of young men, intending to remain upon the farm during their lifetime, going to the university and taking their course in some other college for the purpose of getting a better education than the so-called agricultural course, which only had 1 or 2 men teaching it. So it has taken in these latter days a kind of spasmodic on the part of the public to readjust the matter and develop this subject upon its natural basis. It has been done in a number of the better institutions. This legislation in Illinois last winter is creating a great deal of interest all over the country. From a great many States correspondence is coming asking questions about it.

Q. (By Mr. A. L. HARRIS.) Can you practically outline that legislation?—A. That legislation simply was that there should be devoted one-half of the proceeds of the land-grant act of 1862 and of the second Morrill bill of 1890 solely to instruction in technical agriculture; and it enumerated those subjects to be matters connected with live stock, with the field and its crops, with horticulture and veterinary science, the strictly technical line of agriculture, independent of chemistry and independent of botany; independent of zoology and independent of any of the questions of literature or history or English, but wholly to the development of the technical subject. That was really all there was of it. Previous to that time the question of bestowment of funds was left with the trustees without recommendation by anybody. They were to use the funds where they seemed to be most valuable to the institution, and, naturally, that was where the student pressure was greatest; and after a process of time—as I have already outlined—a weak department grew weaker, and it was less and less respectable in comparison with the others, and drew fewer and fewer students—was on the road to annihilation. That has been the history in very many States. This division of funds was not first made in Illinois; it was first made in Wisconsin; but it was made there by the trustees, who set aside a given fund for the development of this subject regardless of the question whether there were any students at all or not.

I would like to say in this connection that I think the experiment-station work of the last 10 years has been largely instrumental in establishing these colleges of agriculture, because the experiment-station activity was entirely along technical lines, and demonstrated to the people that good is to be had by the scientific study of agriculture. After a few years of that the support of the colleges bettered.

Q. (By Mr. CLARKE.) Do some of the land-grant colleges issue circulars instructing the farmers of their States on certain subjects?—A. Not since the experiment stations were organized. A few of them had commenced that, but now, of course, wherever there is a college there is an experiment station, or, rather, there is one for each State, and there may be more; and I think in every case such publication is made through the experiment station rather than through the college, for two reasons—first, because it is anticipated that it shall be, in the contemplation of the Hatch Act, and, second, because the college has not the frank. It would cost as much to distribute the experiment as it would to make it if postage were paid.

Q. In some States the land-grant funds have been given to existing colleges, which, in accepting the grant, undertook to establish a department of agriculture. Are you familiar with the working of these so-called joint institutions?—A. Yes; I am too familiar with them to be comfortable.

Q. You do not approve of it, then?—A. Why, it is a good deal like the lion and the lamb lying down together, with the lamb inside the lion. All it took to establish such a college was simply to elect one man as professor of agriculture, and then to outline on paper an agricultural course, which differed from the scientific course only in the teaching of this one man. I could show you where that has occurred over and over again. This man had no possible chance to compete with other teachers in the university. (I am not speaking of the University of Illinois; I am speaking of what happened in other States. That never happened in the University of Illinois.) He had no chance to develop the science. There were no books. The man himself did not know his subject. One man could not know agriculture.

Q. Well, take the case of a small State, say the smallest State, Rhode Island, which is not so much an agricultural State as it is a manufacturing and commercial State. Would you think there would be any room in such a State as that for an agricultural college pure and simple?—A. I would think they would do well to develop their college largely along mechanical lines. They have, however, developed quite an agricultural college in Rhode Island. Such a small State as that, situated as it is, off there in the East, has an agriculture of its own, peculiar to itself.

The consequences of this kind of organization were very clearly seen in the fate of the agricultural course that was offered in earlier days. In such an institution it was held that the student should have a good foundation for the study of agriculture, and therefore he must take 2 years of science before he commenced his agriculture. This was the common plan: In the freshman and sophomore years he studied under the finest teachers in the world, teaching old subjects, well established, with good text-books and the best reference books. In the junior and senior years, if he continued faithful to his agricultural instincts, he studied very largely under this one man, and naturally it was an anticlimax. This one man was not educated as a professor of agriculture. There was no school in which he could have been educated as such. He was either some farmer who had succeeded in something—I knew of one who never had been a success except in raising one crop of onions—or else he was a chemist who had been interested in agriculture more or less. His teaching could not develop the subject in comparison with those other subjects. Then, the institutions finding that students did not take kindly to such a course, or would drop out at the end of 2 years or go on with the scientific course, formed a 2-years' course. This 2-years' course was the agricultural end of the 4-years' course; that is, the junior and senior years. There were many institutions which had just such other courses of agriculture—the 4-year course, in which the junior and senior years were agriculture, and the 2-year course, consisting of the junior and senior years of the 4-year course. The student was admitted to either the one or the other, as he chose. Not taking very kindly to these 2-year courses, the short courses were established of a few weeks in the winter. This demonstrated their ability to teach agriculture. The student there studied special subjects for a short time and got ahead in them. The dairy schools were successful. Instruction in veterinary sciences and stock were successful. These short courses developed into longer courses, developed into special courses in agriculture, in which the agriculture is not deferred until the junior or senior year, but runs parallel with the other lines of instruction.

Q. Is there now a fairly good supply of text-books for use in these agricultural colleges?—A. Only fairly good; only in a few subjects.

Q. Do you know of any text-book that is suitable for the preparatory schools—the public schools and the high schools that get students ready for these colleges?—A. I think Bailey's *First Principles in Agriculture* is well adapted to that, and is by all odds the best book of the kind that has ever been written.

Q. Is there any text-book that bears on this question of pure food or the importance of foods?—A. I do not know of any particularly on the question of foods. People who write upon foods do not, as a rule, dwell on that question very much. They dwell more upon the question of food values and the preparation of standard foods.

Q. Do you consider that that subject has been neglected?—A. The food question, you mean?

Q. Yes; the food question.—A. Oh, yes.

Q. And the worth and the hygienic effects of food?—A. I think that feature of foods has been developed rather more than the other.

Q. Is it developed in the text-books?—A. Yes; I think so. I think that our school physiologies, books of that kind that have gone into our common schools, have undertaken to teach the hygienic effects of foods, especially injurious effects of certain things, to a greater degree than any other feature of food study. In

some States it is obligatory that instruction of the effect of narcotics shall be given in the schools.

Q. Can you suggest any new legislation on that line?—A. As to instruction in the schools?

Q. Yes; as to instruction in reference to foods.—A. You mean national legislation?

Q. Either national or State.—A. Oh, yes; I should say assuredly—legislation by boards of trustees or legislatures establishing departments for the study of this subject in these colleges; further, the establishment of departments for this study in the city schools and all other schools wherever it is proper. And I think in the study of this subject, as in the study of agriculture, it should be recognized early and not late, as it was in that, that the problem is to study foods and their characteristics independent of the question whether there are few or many students to take instruction at the beginning of the work. That has been the policy in the larger institutions that have taken up the study.

Q. Can you state what was the effect by way of developing the school of the setting aside by the board of trustees of the University of Wisconsin of a certain fund for the development of technical agriculture?—A. The effect was that of a very rapid development of the school. It enabled them to secure more men, more instructors, to teach the subject better. That was answered immediately by the larger attendance of students, until we have there one of the foremost schools of agriculture in the country.

Q. Followed by original research?—A. Accompanied by original research.

A VOICE. Is that school connected with the agricultural school?

THE WITNESS. Yes; Wisconsin University is an all-round university. I could not say that everything is taught there, because that is not true of any university; but it is one of the great universities where a vast variety of subjects are taught. The point was that every new subject, no matter what it is, has difficulty in establishing itself alongside old subjects in a great educational institution. It has not been the fate of agriculture, because it was agriculture; it will be the fate of any subject; it will be true of Sanskrit or anything else; any new subject can not make its way unless it is well equipped with instructors, so that it may be well taught; that is, won't make its way until it is well equipped; and if it takes 10 men to teach the subject it will not make its way until it has 10 men. If it is a large subject it will need many men.

May I add a word to this effect: I would like to go upon record as recommending the general principle touching all such public inquiry, in the teaching of all new subjects and in the investigations of all new subjects in our Commonwealth, the principle of special appropriations, either Federal or State, for such study and such investigation, for the reason that the experience in putting agriculture upon a teaching basis, begun 30 years ago or more, has shown the difficulty under which boards of control labor who are trustees, intrusted with the funds—the difficulty under which these people labor in following a new subject until it can become established and until people believe in it. Here is a case in hand: The teaching of domestic sciences—that is what it is in our colleges. In prosecuting any work in new and untried fields, if it has to be done out of funds not otherwise specified, boards of trustees and department officers will have great difficulty in defending themselves, if they attempt to set aside a sufficient amount of money to push it until the public really knows it. A special appropriation for the prosecution of such special study is vastly beneficial.

(Testimony closed.)

WASHINGTON, D. C., February 2, 1900.

TESTIMONY OF REV. W. J. GAINES,

Bishop, A. M. E. Church, Atlanta, Ga.

The commission met at 1.20 p. m., Mr. Clarke presiding. At that time Rev. W. J. Gaines, bishop of the A. M. E. Church, of Atlanta, Ga., was introduced as a witness, and being duly affirmed, testified as follows concerning education of the colored race in the South:

THE WITNESS: Gentlemen, my race to-day stands in the crisis of its history in America. We are now solving the problem which many claim to be the most difficult of solution of any before the American people. Still we believe that if

we are true to ourselves, there is no doubt of our final triumph over all difficulties, and of our working out a glorious destiny for ourselves.

The Hon. Pope Brown, president of the Agricultural Society of Georgia, recently appeared before this same Industrial Commission and made the following statement:

"The presence of the negro is the special cause of the want of development of the South. His presence retarded the moral, religious, social, and agricultural development of that section, and if the negro were absent a better class of labor would take their places. The more the negro is educated the less efficient does he become as a laborer. Let the colored race be separated from the whites and colonized, either in this country or elsewhere, in the interest of the Southern States."

These are strange words from so prominent a planter and agriculturalist as the Hon. Pope Brown of Georgia. How fundamentally does he differ from the great masses of the farmers of Georgia whom he is supposed to represent. They do not deem the presence of the negro in the South a menace to the true interests of this country. Upon the State statute books of Georgia there are laws forbidding emigration agents to come into that State and induce or persuade colored people to leave there. This shows that the white people of the South are not so anxious for us to leave the South as Mr. Pope Brown made it appear before your committee. The great State of Georgia recognizes the negroes as the best laborers and farm hands in the world, and it does not propose to exchange them for whites, Poles, Chinamen, or anything like that. And this is true of the Southern States as well as of my own State. So Mr. Brown, in the views he expressed on this subject, arrays himself against the overwhelming majority of the Southern white men. "The more the negro is educated the less efficient does he become as a laborer," said Mr. Brown. Strange words these, too, from a representative farmer of the empire State of the South. Did it ever occur to Mr. Brown that if this proposition applies to the negro it also applies to the white man? Is it not true that under present conditions of agriculture the educated white man takes less to farming than the educated negro? But does Mr. Brown oppose the education of his own race for the same reason? Mr. Brown, as it appears to me, does not grasp the situation. What the white man needs, what the colored man needs, is education, the right sort of education. Let the farmers, be they white or colored, be intelligent, educated men, who will employ right methods, and who will adopt right means, and who will succeed because they love to farm, and who will love to farm because they do succeed. The diversity of farming for which Mr. Brown pleads can be brought about only by an intelligent and properly instructed yeomanry.

Everywhere and on all hands the white people are advocating, and rightly too, thank God, the education of the colored people. The white people almost unanimously concur in this as the solution of the troubles that perplex us. In almost every instance the thief, the burglar, the murderer, the rapist is an ignorant man. How many educated negroes do you find in the jails and chain gangs of this country? They are scarce compared with the army of ignorant ones there. I find this by my own observation. No, Mr. Brown, you are mistaken in both your propositions, and when you publish them to the country you oppose the views of the most intelligent and representative men in your own State.

What the South needs is intelligent farming hands, diversity of crops, and law-abiding, home-loving, and home-building people in the rural districts. The need is intelligence in all farming pursuits, and the man who is satisfied with ignorant labor and believes that such labor can build up the South, or any other country, is simply mistaken, whether he be a white man or a black man. The negro is the most faithful, most industrious, and most reliable laborer that can be had in the South, at least. He was faithful in the time of slavery; he is faithful to-day if rightly treated by his white brother. He needs, like the vicious white men of the South, moral as well as intellectual education. Let no class of men, whether they be white or black, discourage us as Mr. Brown seems to do. The great need of our people is education and fair treatment. Wherever the negro is rightly treated he becomes a good citizen. Naturally he is quiet, and he quickly takes to your civilization much better than the Indian. He is good-natured, the negro is and always willing to do the best thing that he can do for his country and his family. Who can forget the fidelity of the negro in the war between the States? No crime or cruelty marks his record then, and none can mark it now when he is justly treated. The negro regiments were among the foremost and bravest. You will find them on the slopes and heights of El Caney where they consecrated that place with their blood fighting for their country. There is no class of men in this country that is more faithful to the country than the race we represent.

When Mr. McKinley wanted somebody to strengthen the people in these Philippine Islands he called on the Twenty-fourth and Twenty-fifth Regiments, and they went gladly, and they will do as brave fighting down there as any white men in this country. All we want, gentlemen, is fair treatment as a race. They went gladly; they will fight as bravely as any that ever fought under the flag of America. They have done this, and they will do it even unto death.

I say this, and I say it with emphasis, that let our race have a fair chance, let them be educated, and I will assure you that this problem that seems to worry this whole country will be solved in the right way.

Q. (By Mr. FARQUHAR.) Have you had any experience in the educational methods and facilities in the South for your colored men?—A. Well, in the State where I live we have excellent schools—in Georgia. In the city of Atlanta we have more colleges for colored people than in any other city that I remember, except Nashville, probably, in the South. However, many of these colleges are private benefactions. The American Missionary Society sustains the Atlanta University; the Baptist Seminary is sustained by the white Baptist people; the Clark University is sustained by the Methodist Episcopal Church; the Gammon Theological School is sustained by an endowment given by Mr. Gammon, of the Methodist Episcopal Church. We have between three and four hundred scholars in this school. We have regular city schools; not enough, of course; they say they are going to build us more. We are not complaining; we believe and hope that they are doing the best they can. Mr. Hoke Smith told me the other day they were going to put up a very large school very soon for the colored people, which will give us quite a number of schools supported by the city. They employ teachers of our own color, and they are doing well in that direction. We have from three to six months school throughout the State—in the country I mean—and the colored people are accumulating property. Many of them have their own homes and plantations paid for. Of course they meet with reverses like white men do in business. We have not had the training that you have had. It has taken you all of this time to make such men as you have, and we think if you give us the same length of time we will make men about as good as what you have. We know you are great; we admire your pluck, and your ability in sustaining yourselves. We are chasing you as best we can. We have had only 35 years to do this work in.

Q. Do you find cooperation on the part of the whites and negroes in Georgia in procuring and maintaining the facilities of education in the cities pretty generally?—A. Yes.

Q. There is no particular prejudice, is there, among the whites there against the colored people, as far as education goes?—A. Well, in sections there is some, but the majority—I think the influences among the better class are now favorable.

Q. Is there any discrimination, particularly against colored people, there in the rural counties of Georgia—purely agricultural counties?—A. Well, the white people get the most money, get the best pay for teaching, and have the best schools.

Q. Do you think there are adequate facilities for schooling throughout Georgia?—A. No; it could be improved wonderfully.

Q. Can they give more time to education for their children, considering that they have crop raising to do and all that?—A. If you mean to ask if they could give more time to educating their children, yes; if they had the means to support them.

Q. The education you speak of in these schools under endowment, the schools under the church and all that, have you any knowledge of the arrangement of the curriculum in these schools?—A. They are about like other colleges. I suppose our colleges in Atlanta rank with the high schools in New England.

Q. You grade them with the high schools?—A. Yes; that is what we claim. I do not know whether we are up to it or not.

Q. Is it your intention to give such education in your colored schools as will usually fit them for life, or is it for professional life, or is it for school-teachers or for mercantile life?—A. For general usefulness. We are educating our people so they will have an industrial education, but we believe equally as much in higher education. We think the colored man can not succeed unless he can get a higher education just like the white man has got. Of course we know the masses can not be college graduates. We have lawyers and doctors and preachers just like other races, and we need them.

Q. You have quite a large knowledge of your own race and their capabilities. Do you feel in your own mind that it is better to educate and train them in the industrial schools and agricultural colleges, so that they are sure to make a living anyway, before they adapt themselves to the higher education?—A. I believe in industrial education just as strongly as you do, but I do not want to neglect

the higher education by putting all the forces into the industrial education. Of course we know our people are laborers generally. Our people are the poorer classes, and we can not at once hope to get up just where the white people are to-day; but it is our intention somewhere in the future to reach the highest standard of education and wealth that is occupied by the best white people of the country.

Q. What is your opinion of the industrial schools for colored people in the South now?—A. Well, those that I know of are very good, and they are doing good. I would not say a word to discourage them. I rather encourage them. But at the same time I do not want to speak so as to injure the idea of higher education.

Q. (By Mr. KENNEDY.) A gentleman who was before the commission some time ago made a statement that I would like to ask you about, and I would like to say first that I believe he is a friend of the colored race. He so impressed the commission. He said that the condition of the negro, in his opinion, was this: Since they were freed one-third had gone up, a third had remained stationary, and a third had retrograded. I should like to ask your own opinion as to that statement?—A. I do not believe just as he does. In my own State, directly after the war, there were only about 3 per cent colored persons that could read and write. We claim in Georgia now that 50 per cent can read and write. Now, that shows at once that half have been increasing. That knocks out one-third of his statement. I know that our people are just like white people; some of them are careless, unconcerned, and not interested about elevation. But I believe that I can make a calculation and say that at least, well, two-thirds of our people are pulling up. Considerably over one-third have made a wonderful advance. May be this gentleman has studied the question closer than I have, but I doubt his statement. I give that statement that we claim 50 per cent in Georgia can read and write—I give that not by my own figures, but by those who have been investigating. Now, I suppose that will average pretty well all over the South. Therefore I think the gentleman is mistaken.

Q. Where did you get the statistics in regard to that; through your churches, your schools, or State authorities?—A. I got this from the State authorities.

Q. That is, the statistics of Georgia?—A. Well, I got it through Prof. Richard Wright, who is now at Savannah, a professor in our agricultural school. He has investigated that, and I got my figures through him. He is a very close student and has been teaching for 24 or 25 years, and I think his opinion on that is worth a good deal. He has had time to look into it. He was at my house a few days ago and he gave me that statement. And Mr. Glenn made the same statement to me. He is superintendent of public instruction of the State of Georgia.

Q. Do you believe that the colored people who have remained in the rural communities there have a better moral and educational condition among them than those who have flocked to the cities?—A. I do not know. Now, if you will let me speak of a certain class in the cities, there are some persons in our cities that live on the alleys, on the back streets, where there are all classes of people, white and colored, and of course the morals of that class of people in the cities generally are about as good as the average. Now, any class of people who do not work, who are idle, whether they are white or colored, and lying around on the alleys and back streets—they are malicious and bad; but that does not apply to my people any more than it does to others. I think the people in the country are busy at work. They may not have all the intelligence of a good many people about town, but they have something to do, and persons who are busy are not so apt to be malicious and bad; and I think our people will compare favorably with other races.

Q. I think somebody gave testimony here to the effect that the negro race had been injured to a large degree by a large number flocking to the cities?—A. Well, if we were shrewd, if we had had judgment and sense, we could have bought up all the land when the white people were discouraged, after the war. We could have been rich to-day, but we did not have sense enough to do it at that time. We regret very much that we did not take hold of the farms shortly after the war, when the white people were discouraged, and bought the plantations; we would have been the rich people to-day.

Q. Could you have done it?—A. Oh, I think so. We could have gotten a lift. If we could not have gotten all, we could have gotten a good share of it. It was a mistake we made, and I regret it very much. Of course I have gained light by reading newspapers and keeping up with the country. We did not know it. We ought not to be blamed for that, because we have been slaves.

Q. (By Mr. RATCHFORD.) Were you a slave?—A. I was a slave until 1865, but I always had some ideas in my mind about the environments around me. I was raised up among the best class of people that Georgia ever produced.

Q. (By Mr. CLARKE.) How was that?—A. When I was a boy 4 years old, I used to see them standing around discussing great questions, and I used to wonder why my father did not take part. I did not understand what slavery meant, and I wondered why he did not get around and discuss those questions with these great men. I said if I got to be a man I would do it. I used to hear the very best men—Robert Toombs, Alexander H. Stephens, Howell Cobb. That was the class of men I was brought up with. I was not at liberty as they were, but I certainly took advantage of my environments.

Q. (By Mr. RATCHFORD.) It has been suggested that the colonization of the colored race in the South would tend to the advancement of the race. What have you to say on that subject?—A. I do not believe it. I think we are American citizens, and if they will just let us alone, and help us whenever they can, we think we will work out and solve the problem right here in America.

Q. Would you suggest then to the commission why you are opposed to it, and show wherein the assimilation of the races would tend to produce better results for the colored men?—A. I am opposed to it. If the white people will not treat us right here right among them, and should give us a colonization site, and some of our people should go over there, the white people with their intelligence would come over there and take advantage of us just as quick as they will here, and I think we had better stay here and fight it out right among them. I think we will become stronger by staying in your company. I think that to colonize us will be detrimental to the race. That is my opinion. We are sure we can not keep the white people away from us. If we were colonized we could not do it. They would come over there to make money.

Q. Is it not a fact that in parts of the Southern country the colonization of the colored race is already being practiced?—A. I do not know how far. I have not been to any place where the white people were not controlling it, even in the Indian Territory.

Q. For instance, there are, according to the information received by this commission, certain communities, villages or hamlets, as the case may be, that are entirely peopled by the colored race?—A. It may be on the outskirts of some town. Lots of white people do not like to have property near colored people, and they will not let them get property on the best streets. Now, I remember when I was trying to buy a lot for myself in Atlanta, every agent that would come around would take me down on an alley or a back street to show me some valuable ground. I told them I did not want to live on an alley; I wanted to live on the hill. The white people say we are no account, and they always invite us to some alley. I told them I would not have a home if I could not get it on the hill. And in many of our Northern cities they are not willing for us to have property next door to them, not even if we are superior negroes—superior to the white man next door to us. They do not care about being your neighbor. It is that caste prejudice and feeling which is in their hearts, which is harder to burst than steel.

Q. Then you believe that the best results will accrue to the colored race along economic lines, by assimilating with the white people as they assimilate to-day?—A. Yes; and let the white people just treat them justly; allow them a chance as they do other men; do not take advantage of them. Of course they will do better. That is my opinion.

Q. (By Mr. FARQUHAR.) Is there a compulsory education law in Georgia?—A. Well, no; it is not compulsory in that State. They expect everybody to send their children to school, but they do not compel them.

Q. All the colored children who go to school then go voluntarily or under the influence of their parents?—A. Yes, under the influence of their parents. That is so with the whites, too.

Q. Is there a general tendency among them to get an education, or are they more averse to it than the whites are?—A. I do not think so. I think directly after the war there may have been more enthusiasm with the masses; it was new. But then our people are as anxious to go to school as the average white boy. That is my opinion.

Q. Where is the greatest illiteracy to be found, in the cities and large towns or in the back rural districts?—A. In the rural districts. They have not had the opportunity, you know, as they have had around the cities, and the city life, you know, naturally has its tendency to make a fellow wise if he just stands around and sees the other fellows. It may not be good, but still they will get wiser by being around where the wiser people are.

Q. Do the rural districts encourage and help the colored people to get an education as much as they do in towns?—A. Well, no; not altogether. They have not the same interest, they have not the money, and they have not the interest in the rural districts. The people in the city are considered to be more highly civilized, even among the white people, than those in the rural districts.

Q. Have you any specific recommendations now as to any change in the laws of the State or of the United States to improve the condition of your race?—A. I think if Congress could make a law whereby they could prevent a State from passing class laws, that would be a great thing for our people. If the United States would so amend the Constitution that wherever a State makes a law discriminating against colored people on account of their color or previous condition the United States would just call that law null and void I think that would help wonderfully. In fact, I am opposed to State rights, especially when the States will not obey the intention of the Government.

Q. (By Mr. KENNEDY.) I presume you are well aware of a practice that has been carried on among the colored people in certain parts of the South—that is, of designing men going among them and leading them to believe that they can secure the passage of a slave pension law, and organizing societies and the like of that?—A. Yes.

Q. Has your church organization sought to enlighten the people on that subject?—A. Oh, yes.

Q. And warn them against such men?—A. Yes, we have as individuals; as ministers. We have not made any special organization, but the intelligent ministers of our church know that can not be. In fact, I do not see but one way that we could have such a law as that. If the Government pays the Southern people for their slaves it might pay us for being slaves. If you pass that, I would get a list of all my past generations, and I have a large number, and I will get about as much as any other man will get. [Laughing] I would not object to getting the passage of the bill. [Laughter.]

Q. (By Mr. CLARKE.) Have you anything further to state?—A. I have nothing more to say.

(Testimony closed.)

WASHINGTON, D. C., February 2, 1900.

TESTIMONY OF REV. A. GRANT, OF PHILADELPHIA,

Bishop A. M. E. Church, Philadelphia, Pa.

The commission met at 1.30 p.m., Mr. Clarke presiding. At 1.55 p.m. Rev. A. Grant, of Philadelphia, a bishop of the A. M. E. Church, was introduced as a witness, and, being duly affirmed, testified as follows concerning the education of the colored race in the South:

Q. (By Mr. CLARKE.) I will inquire first if you represent the church South or North?—A. My home is in Texas when I am at home. I am officially living in Philadelphia. I have charge of the State of South Carolina aside from my work up here. I was brought up South.

Q. You have heard the evidence of Bishop Gaines, especially in regard to the condition of the colored people in Georgia. How does that represent the condition of your race in South Carolina and in other Southern States where your acquaintance extends?—A. The conditions in the South, or in the States where slavery existed, are generally about the same. The school facilities in Texas are better, perhaps, than in any other State where slavery existed, on account of the school fund being larger.

Q. Is there any discrimination between the races in the enjoyment of the use of that fund?—A. I am not sufficiently informed to answer that question. I do not think there is, except at the university of the State. Our people are not allowed to go to that. But we have high schools for the colored and high schools for the white, and the very best teachers that we can secure. We have a State normal that has been there nearly 20 years, sustained by the State, and a couple of students from each district represented in the State legislature—perhaps senatorial district—are allowed in there without cost.

Q. Do these graduates of the normal school become teachers as a general thing?—A. Yes; they are required to teach, and with a certificate from the State normal they are assigned to schools by the boards wherever they wish to employ them.

Q. Are teachers in colored schools paid as good wages as those in white schools?—A. There is one examination for each, and they have what they call first, second, and third grades, and they are paid according to their grades, I think, regardless of the race to which they belong.

Q. You are now speaking of Texas?—A. Yes.

Q. Is the same true in South Carolina?—A. No; it is different in South Carolina. The school fund in South Carolina is not as large as it is in Texas. But Bishop Salter, who will follow me, will better inform you of the State of South Carolina, because he lives there and has been brought up there.

Q. Is there much encouragement offered in Texas to industrial education?—A. Yes; I think that Texas is in advance of all the Southern States along that line—education generally—and all of the leading journals of the State oppose this idea of emigration and this claim that they do not need colored people in that State.

Q. Do you think there is any prevailing sentiment among the white people in any part of Texas for the exclusion of the colored race from the State?—A. The Farmers' Alliance met a short while after the Farmers' Alliance of Georgia met, and passed resolutions, as the papers said, asking Congress to make an appropriation sufficient to send the negroes away from the State—as I saw it published in the papers.

Q. Well, is it your opinion that the Farmers' Alliance in that respect fairly represents the opinion or wish of the white farmers of Texas?—A. I think they represent that class, but not those who control the State. You see, the negroes have become competitors of these farmers, and they can do more work—till the soil better and do it with less cost than these people who have gone to work since the war. We did it before, you know, and these people who have to compete with them would like to have the Government spend several millions to get them out of the country. The soil owners, the people who really own the soil and control the State, are not in accord with that class of people, in my opinion.

Q. (By Mr. FARQUHAR.) Is this so-called Farmers' Alliance mainly an industrial organization or is it a political organization?—A. Oh, I think it is industrial; it is the farmers of Georgia—the farmers of Texas. The president of the same association of the State of Georgia made the statement that there were several of the leading negroes who wanted colored people to go away, to go to Africa, and that he did not know whether our plans were practical or not, but if they were not, he would recommend that practical plans be arranged, and that the negroes be sent back or allowed to go back, or something of that kind; and you will remember Senator Tillman, of South Carolina, followed, recommending that a hundred millions be appropriated this year, and it was to be supplemented each year with a hundred millions, to send them somewhere, he did not say where.

Q. Do you know whether this demand on their part there for the migration of the colored race is on account of the competition of the colored race with the white race or to get rid of the colored race which is there and bring in another class of immigration?—A. I do not know, but I have my opinion, and that I have given you—because they compete with the others, and the white race can not compete with the negroes in these States where slavery existed, as farmers—in none of those States, in my opinion.

Q. Still, as far as you are concerned in agriculture in Georgia and other States there, there is no competition between the white and the colored man surely; is not the poor white there paid about the same wages as the colored man usually is for the same class of skill?—A. Whether he is paid the same wages or not, I am pretty sure he is not treated just exactly the same; I do not know about the wages.

Q. Well, independent of the question of color, I am speaking about just simply hiring for what work there is at hand.—A. Well, there is this about it: You will find that there are rich men in most of these States who employ colored labor; they can get it a little cheaper than they can the white; they can have them work perhaps a little longer, go to work a little sooner, and vacillate a little more about settling the bills; and since they can do that, why, of course, the whites want that impediment out of their way. You will bear in mind that the Knights of Labor some years ago—that the whites took the negroes into their organization, to the Knights of Labor, and I think in one case, that at Plaquemine—what is the other place?—there were 35, I think, killed.

Q. That was at New Orleans?—A. Plaquemine, Thibodaux, where they had a fearful break-up, and they dispersed the Knights of Labor so far as it existed among the negroes and broke them up. Now, the whites had commenced that organization in the South, and that shows they would like to have them with them or dispose of them as competitors.

Q. (By Mr. RATCHFORD.) You have stated that colored labor can be procured at less cost than the white labor?—A. That is true.

Q. What effect has that on the white laborer; does it not tend to keep his wages down?—A. Well, it depends on who employs him; in some cases it does. There are some people who believe that it costs the white man more to live than it does the colored man, but it is one of the reasons I give for not returning them to

Africa, why the negro should not go to Africa. On the west coast there can be employed for a shilling a day all the native labor you want, and to dump the American negro in there and send him there when he has been getting 75 cents or \$1 under a higher civilization, of course, he can not compete with them. On the same principle I speak of these people South.

Q. Now, it has been stated before this commission that agricultural laborers in the South usually get a little home in which to live, a little garden spot, and from \$4 to \$6 per month as wages; added to that is a certain quantity of corn meal—a peck or a half a bushel of corn meal—and some maple sirup. If that be a fair statement as to wages paid for colored labor in the South, I want to ask how it is possible for the white laborer to get a much higher price as long as there are colored laborers to employ at that rate?—A. I do not know. If you force us to take that or die we have got to do it, and the whites will have to do the best they can.

Q. You assume that the white man is responsible for it, inasmuch as the white men are employers?—A. I assume that the white man is responsible for the conditions that exist in every Southern State.

Q. What class of white men? There are the employers and the employees, the man who hires and the man who labors.—A. Well, there are some conditions that the men who hire are responsible for; there are others who are responsible for the other conditions. For instance, you will hardly get a gentleman to go out and join a mob, but you can get a lot of roughs, full of bad whisky, and they will go out and get together and take a little bit of a negro—two or three hundred of them—and swing him up and go back home and report that they have achieved a great victory, and the poor little fellow is not worth killing, hardly.

Q. Then it is your opinion that this strife as between the races reaches into almost all the walks of life, reaches into their labor and into their households?—A. In certain sections it reaches into the households, maybe, but there are only fourteen of these States where slavery existed; but in all the balance of this country—you can take the territory from California right around in all these States and come down here to New Jersey, and it is not so, and there are negroes in every one of them; I have been in every State of the Union except three. And it is the same way in the islands. Go down here to Bermuda; there are 10,000 negroes and 5,000 whites. It is just as peaceable as can be. You never hear of a lynching nor the other crimes that are said to be so prevalent here. You go to Barbados—well, you take all these islands under the English flag, and it is generally so. There is Sierra Leone; the governor is appointed by the Queen and so is the secretary of state. There may be two or three hundred whites and there is 30,000 population. They never heard of such a crime and never heard of lynching. Go around all these States in our own country and you do not hear it. Now, somebody is responsible for the condition. We do not enact the laws; we do not administer the laws; we have nothing to do with the running of the Government, and those who govern are responsible for the governed.

Q. Without going back to that question, what have you to suggest looking to the equalization and improvement of the condition of agricultural labor in the South as between the races?—A. Well, there are a good many things we can do. You know men of intelligence can serve their country, serve their God, and serve themselves better than the ignorant man. Now, if these men who desire to give \$100,000,000 a year to take us away will put those millions in industrial schools in our Southern States and let a man become an intelligent farmer, an intelligent carpenter, and, indeed, all that is required to run the country, and then give them an honest day's wages for an honest day's work and pay that money when it is due, and let us all feel that we are at home, and that when we come before the courts justice will be done regardless of our color, I think conditions will be better.

Q. Of late years is it not a fact that the industrial classes of the South, without regard to their color, have been banding themselves together in trade organizations for the protection of their labor?—A. Well, not without regard to color. In some places the colored man is in it where he owns a great deal. Now, I do not believe that you really know the wealth of the South. I was invited to Texas to deliver an address last October to the Farmers' Improvement Association. I think there are 2,200 men who belong to the organization in the State; and the gentleman who has organized this association says that he can prove that the negroes of the State of Texas own about \$80,000,000 worth of property. You do not seem to know that the sugar of this country is generally made by the negro. I pressed upon the President to give us a member of this commission, and he said he would do it. Why he did not do it I do not know, but I gave him my reasons for it. Send your commission to Louisiana and examine the sugar farms of that State, and then see who grows the sugar cane, who takes it to the mills, who

makes the sugar, runs—well, not the engine, perhaps some white man runs the engine. You will find around Mr. Gay's farm alone perhaps 500 negroes at work and enough white men to run the business. Now, that is usually the case, and what is true in that State is true in others. Then go over into South Carolina, in Georgetown County. I went through that country last year, through the rice farms. In the month of June, I guess it is, the white people move out and go away.

Bishop SALTER. The 10th day of May they move and return the 10th day of November.

The WITNESS. Now, they come back about that time. During their absence the colored people are taking care of the rice farms. What is true in that State is true in Georgia; so you see that we make the rice, grow the rice of the country. There have been something over 9,000,000 bales of cotton made this year or last year. Send your commission out and let them examine these surrounding conditions, and you will find that the negroes made about 7,000,000 bales of the cotton. The only way to see that fairly and squarely is simply to go upon the farms and ask the farmers. You need not go to the town and ask the newspaper reporters or the hotel keepers or anybody else. If you will go to the farms you can ascertain the facts. So I do not think they should regard color; I think that they could get together. In some cases the colored people are allowed in it, and in many they are not. They would allow them to organize themselves separately if they would do it, and in some cases they advised against it, because the rich people and the educated people of the Southern States are the friends of the negroes, and we do not want to organize against them.

Q. I am doubtful as to whether you grasp the meaning of my question. The point that I wish to make in this connection is simply this: to show whether or not there is a stronger tendency of assimilation between the races than there has been at any previous time. We will take, for instance, the trades in which both the white man and the black man are generally employed in the South; take the mining trade, for instance. Is it not a fact that some few years ago there was no trade organization among these people excepting in a separate form; the white men had their own trade organizations and the colored men had theirs? Have you any knowledge on that point?—A. I stated that with reference to the needs of labor, you know.

Q. Is it not true that at this present time and for the past year or two, I believe, or more, these races are getting together under the banner of one organization to protect their labor?—A. If that is true, I do not know it. I hope that it is.

Q. (By Mr. KENNEDY.) We were talking about the colonization of the negro a while ago. I should like to ask you if in your opinion the American negro does not love this country and consider it as much his home as the people of American, or German, or Irish, or Scotch descent, of the second, third, or fourth, or sixth generation, and whether it is not an impossible task to get him out of the country?—A. I do not think, as a general thing, that the negro feels himself as much at home as the classes you have mentioned, from the fact that he is discriminated against more than the other classes; but I do think it is impossible to get him out of the country, and it is foolishness to discuss it, and you had better make some other arrangements. We are going to stay with you. It is our country as much as anybody else's, and when the classes you refer to begin to go out by shiploads, we will consider it. But there is a large contingent that think otherwise, bear in mind.

Q. Is there any colored contingency?—A. There is a colored contingency—not so large; but there are many people in our country—mainly resulting, I believe, from the thought that they can not secure their rights under the law, especially; that we are being discriminated against; that the separate-car system in Georgia, which now has come to Virginia, and runs its cars in under the very Dome of the Capitol, are indications of a darker future. But we are not discouraged. We feel that we are in a transition state, and that it may be the advance march of the people that causes such action sometimes, and that we will reach a settlement after a while best for all concerned. I am not discouraged at any law that has been passed, for any law that is passed discriminating against a people will work to the detriment of those who pass it after a while. It may be years, but it will come.

Q. Would these discouraged ones go to Africa if it were made easy for them to leave and go there?—A. I think Bishop Turner is better informed than myself. He says that there is a large number who would go. I believe they would. But the French own 1,500 miles on the west coast of Africa; Germany owns a very large portion of it; England owns every important key, and is now building a railroad from Cape Colony to Cairo, 5,000 miles long, and 1,500 miles of the road

already completed. The only portion of Africa to-day that is owned and controlled by the negroes is Liberia and Abyssinia, and if you expect to send these people there that have helped to make this country what it is, and developed its agricultural resources—send them down there among people who speak foreign languages, because no one speaks our language but the English, and there are 200 different tribes and that many different languages—what are our people going to do, reared under this civilization, in a country like that? The money you would spend in sending them away you had better spend in bettering their condition here and seeing that the laws are enforced and justice done to all concerned.

Q. I want to ask your opinion as to whether any considerable number would go?—A. I do not think there is a number sufficient to affect conditions here. I think a few shiploads would go if you would give them free passes, and I believe they would come back if you give them passes to come.

Q. Would they not go with a spirit of adventure rather than disgust with conditions in this country?—A. I do not think they ought to go at all, but I believe there are some who, on account of conditions here, would go almost anywhere. I do not know what spirit would actuate them; but there is no reason for the colored people leaving the country. It is our home. We have helped to make it what it is. We ought to feel at home, and since the thirteenth, fourteenth, and fifteenth amendments to the Constitution, now and then when we see these resolutions called up to send the negroes away we feel like calling a meeting to send all the whites away. I only say that to show the ridiculous side of the thing. We have just as much right to do it as the other people. That is what I mean.

Q. (By Mr. CLARKE.) Did you live in the South before the civil war?—A. Yes. The man whom I was associated with in the South came 50 miles 3 years ago to see me while I was holding a conference in Tampa, Fla. He got about \$6,000 for me in Confederate money, not because I was so valuable, but because the money was so worthless.

Q. You are familiar with the industrial conditions of the negroes on the large plantations at that time?—A. Well, in some cases; yes.

Q. How many mechanics of various kinds are there among the negroes to-day compared with that period?—A. That would be hard for me to answer. Mr. Booker T. Washington is better informed on that subject. You know as well as I do that those that had large farms, the wealthy people, had two or three mechanics on their places, and would always keep someone working along that line; they would keep mechanics to build their houses, and so on. I mean mechanics and carpenters.

Q. Is there an inclination among your people to learn trades nowadays?—A. Yes; the industrial feature of education is becoming more prominent among us than ever before. Of course we have access to all these institutions in the North, these colleges and universities, in Pennsylvania and Massachusetts, and if we had just one or two in the South, that would give us the higher education. If these hundred millions that are offered to send us to Africa were put in the industrial schools, it would, in 50 years from now, be better for all concerned, because we would have intelligent farmers and intelligent everything else.

Q. Does the colored mechanic as readily find employment as the white mechanic?—A. In the Southern States. You know he does not find it very much up this way. In New Orleans Captain Joseph put up the largest building of the sort in the city and used white labor to do it. He is living in Colorado now, I think.

Q. Do white and colored mechanics work pleasantly side by side?—A. No; that is not true anywhere in the country except in isolated cases. You know in our Southern cities they sometimes employ them as wage workers by the day, and they work together on the buildings, but often contractors among our people do the work.

Q. Do white men work under colored foremen or bosses to any extent?—A. I would not say to a very great extent. They sometimes do, but it is seldom.

Q. Do the colored people develop as much skill on the average as the white people in the mechanic arts?—A. We think so.

Q. In a small country town where there is 1 white carpenter and 1 colored carpenter with equal skill, do the white people employ the colored carpenter as much as the white carpenter?—A. In some cases that is true, especially where the colored carpenter has been brought up in the community and lived there, and the other man is a stranger. I think that is true of Greenwood, S. C.

Q. How much of the race prejudice is due to color, and how much is due to the unwillingness of the whites to allow the colored people to participate in politics?—A. Well, I do not know how much of it is due to color, but the negroes are coming to think it to their best interest to keep out of politics.

Q. Are they refraining from participation in politics more and more?—A. I think so.

Q. Do they vote?—A. Well, I can not say, because I do not attend the elections; have not for 4 or 5 years. I vote. I think the most intelligent men, who can understand what their rights as citizens are, and who feel independent, and feel that they are not endangering themselves or their families—I think they would vote.

Q. Why do they refrain from voting in any case? Is it because they think it is dangerous to vote?—A. I think that the colored people have had trouble in the past because they voted along certain lines, and rather than have further troubles they have rather refrained. There are those who keep up with these conditions as well as myself, because the papers say they are kept away by intimidation and not allowed to vote. That is what the papers say, and that is all I can judge it by, because I do not go to the place of election. It is not always the pleasantest place to be in some sections on election day.

Q. Is it your opinion that the industrial, educational, and moral condition of the colored people would be better promoted by refraining from participation in politics than by participating?—A. I think they, if protected by law, will reach the same results by voting that all other people in the country reach. If the negro were allowed the representatives to which he is entitled on account of his vote now in Congress our conditions would be better. I was in the House of Commons in London when there were 104 Irishmen there representing Ireland, and they could make demands and represent their interests so that it had its effect; and to give us 49 votes in Congress and then have only one man here, why, it is unfair, because in many instances our interests are misrepresented.

Q. You believe, then, that in a popular government participation in politics, properly and fairly protected, promotes the general good of any people?—A. I do.

Q. (By Mr. FARQUHAR.) I would like to ask your opinion as to whether participation in partisan politics has helped the negro in the South since he has had a vote?—A. I think in some respects it has helped him and in others it has damaged him.

Q. Are you aware that it hurts the white man in the North just as much as the colored man in the South to take too much politics into his business?—A. I have stated that I thought the participation in politics affected all races alike.

Q. Do you believe the most advanced colored man you have had in this country who has taken up political lines has ever helped your race a particle?—A. Yes.

Q. Who?—A. Frederick Douglass stood more prominent, I guess.

Q. That was the old slavery times. Since then?—A. He has just gone a few days ago.

Q. Since you have had a ballot, how much did Frederick Douglass ever get you in legislation?—A. He helped to mold public sentiment and that sentiment was crystallized into legislation in some cases. If Frederick Douglass did not help to mold public sentiment in this country, then no man ever did.

Q. I mean political public sentiment; I mean politics as a business.—A. I do not think there is much business in politics but drawing your wages.

Q. Do you think this agitation of politics in the South, as well as some parts of the North, has been really detrimental and prejudicial to the best interests of the colored man?—A. Yes; the people that live in a country, who are the weakest financially and intellectually, who can not control the offices, and the wealth belongs to the other people—in that section of the country where they live it would be better for them to ally themselves with the people who have proved to be their friends. Yet negroes do what any other people would do under the same conditions. After the war closed, the people who came down there, you know—I remember it very well—how it affected all of us to have these men make speeches all over the State: "Now we have come down and set you free." We thought them angels of light come in there, and whatever they told us to do we would have done it; and they are largely responsible for the condition of the colored people now.

Q. Do you not think if there was, say, 50 per cent more education placed in the hands of the colored people of the South, and they accepted it, that a good deal of that would be used in public discussions of public matters, thus intensifying more the prejudice in the South against the colored man? Do you not think, in other words, that if an education other than a purely industrial one were placed in the hands of the Southern colored man and he takes a political line or bias with it, that he is going to do more harm to his race and himself than he would if he remained uneducated?—A. I think the development of the human mind, with the same environments, the same associations, brings the same results; whatever would happen to any other people would happen to us.

Q. Do you not believe the true way of educating the colored man of the South is to educate him in his material condition first, and then his social and religious condition afterwards?—A. I think, because we may die at any time, you had better commence with the religious condition, because we will have to appear before the Judge.

Q. He would judge us according to our opportunities.—A. That is according to his own belief, which our country allows to every man.

Q. A man of middle age or beyond middle age cares nothing at all for an education; but for the children he is raising he desires that they shall have a reasonable education. Is it not the best way, both for his moral and social condition, that that man should be educated a good deal on industrial lines, independent of these public questions and higher education?—A. I do not believe it can be done independent of public questions. A man that lives in a country where the newspapers are giving information all over the country can not be educated independent of public questions. I believe he ought to have industrial education, and I emphasized that in the beginning. With the hundred millions that they want to use to send us to Africa—if you had a school in every Southern State like Mr. Washington's school, and that sustained by the Government—if you want to do something real, that would be the thing to do; but I do not believe that that ought to be exclusive of the higher education.

Q. What advance do you think there has been in the social condition of the colored man since the reconstruction of the South?—A. I do not think we can really give the advance we have made. In the first place, in many of the Southern States where there was no law legalizing the married life, all that has passed away. That is one thing I wish your commission could do; simply go to our Southern States and on our Southern farms and into our homes and see how we live. I can take you to some places where we own 40 miles. Go to our homes. You can never do us justice until you do. That is why I insisted so strongly on having a man on the commission that you could send. I know you know a good deal about the South from your point of view, but you can not see it from my standpoint, and here we have reached a period in the country's history where you are allowing every legislature to pass these class laws to which Bishop Gaines referred, and class legislation. You are allowing the legislatures of this country to enact class legislation, discriminating against a man because of his color all over our Southern States now, and that was not done either until the Supreme Court annulled the civil-rights bill. What are we to do? We are not in a condition to help ourselves. Certainly we can not pass laws. We can not be in the courts. We are not tried by our own people when we come before the courts. Even the jailers and all the representatives are of the other race. Now, whatever will better our condition, the better-minded people of the country, it seems to me, ought to rise and do it, because we are helpless so far as we are concerned. And these people who come here—how can he know unless he comes to our homes. Come to our farms; come to our schoolhouses. I think there are about 170 in the South. They have done a splendid work. See Atlanta, to begin with; New Orleans has about the same number; Charleston, Nashville, at the capital of Texas, Marshall, Tex. It is hardly necessary to name all these strong institutions. About 30,000 of our young people will graduate in the next 2 years from these institutions of learning. You can see at once when we have learned to respect the marriage vow and enter into these different relations, the great improvement that would be made along the social line to which we refer.

There are many men who testify before you from what they observe without coming in there, and what they have read, may be; and if there was some one who could simply take down the facts—and it is such a critical time that this commission ought to get us down correct; and I would like for foreign countries, as well as our own, to know that we are producers as well as consumers in America, and a very important factor in the country.

Q. How are the homes inhabited by your people constructed now as compared with the cabins that they occupied before the civil war?—A. That is just as the other. The improvement is so great I can not begin to describe it. You will find in all the towns and cities an improvement in the homes. The Farmers' Improvement Association has taken hold of that.

Q. How many rooms were there in houses occupied by colored people before the civil war?—A. There were two, sometimes. I mean in the country—in the rural districts. But you will bear in mind in these States to which I refer there were very few homes occupied by persons who owned them. They were all slaves, you know, and they were in the homes that were furnished them. We are in homes now that we furnish.

Q. How many rooms now in houses of your own?—A. They will run from 2 to 10—I guess 12.

Q. They are more moral than under the earlier condition?—A. Oh, yes.

Q. There is greater regard paid to morality in the home than there was formerly, is there not?—A. Oh, certainly.

Q. (By Senator KYLE.) You spoke of graduates. What percentage of these young men are going into the professions—law, medicine, and theology?—A. I do not know the percentage. In my own State that I refer to, Texas, we have a medical association.

Bishop JENIFER. About 40 per cent.

WITNESS (continuing). Dr. Jenifer says about 40 per cent. Dr. Jenifer says the balance are forced into the industrial line.

Q. Are the 60 per cent forced into industrial lines? Are they not there from choice?—A. You see where these people are educated and come North, they come back wealthy, and on steamers, etc., because the conditions in the South are not congenial with their education.

Q. Do you consider it a misfortune that young men who have had a college course are forced into industrial pursuits?—A. No; I think everybody ought to work, and do the kind of work they can do.

Q. I think we are trying to teach the young men in the white colleges that it is a great thing when they get a university education to go back into a business life. The farmer is a better farmer for education; the mechanic is a better mechanic; the business man a better business man; and I think the day is going by when a young man thinks it is a disgrace when he gets through school that he has to go back into the business pursuits of life.—A. No doubt about that. We have medical associations in the State of Texas. They have a large medical association among the colored people, and they are doing well. There are not very many young men at the bar yet.

Q. These young men who graduate from college—have they taken the full curriculum of the college course?—A. Some have and some have not, of course.

Q. They graduate from the industrial course, some of them?—A. Some of them; but we have college graduates all around over the country.

Q. Many have gone into the legal profession?—A. Not very many. I do not think we have as many persons in the legal profession as we ought to have in the Southern States, from the fact that they discriminate sometimes. The mere fact that they are colored, in coming before the court, sometimes makes them lose a case.

Q. I have heard it stated that the colored people themselves are loath to employ a colored attorney.—A. You are aware of the fact that if we had a difficult case in court, and we thought by employing a colored man it would endanger our case, we would feel, at that critical time, like getting a man that could win the case, and we would leave the color line out of it.

(Interruption by another Bishop.) And then our standpoint on that question is seen in the employment of colored doctors. The colored doctors have now almost universally the practice among our people. That shows the sentiment.

Q. It is the same as with the whites. When you get into a difficulty you want a man who can help you out?—A. The general feeling is that the community should treat us all alike, without regard to our color. All we would like to have is justice under our law, and nothing special. If you force me to pay the same fare you pay, give me the same accommodations that you have on the railroad.

Q. You are speaking of the civil rights?—A. That is civil rights.

Q. (By Mr. KENNEDY.) Why is it the colored people in a city like Washington, for instance, do not conduct large stores that might be patronized by the colored people and give employment as clerks and in other capacities to colored people; is it for lack of funds or lack of knowledge in business of that kind?—A. Well, I think it is for the lack of capital, and perhaps for the lack of business ability; but I am not sufficiently informed to give a definite answer with reference to Washington. There are cities where we have large stores. In Ocala, Fla., we have one of the largest business houses of that city, owned and controlled and run by colored men; and I do not know how many colored clerks, and they even do a banking business. That is true in Ocala, and you will find it in many cities.

Q. Do the colored people patronize them?—A. Yes. I was there one day when he told me next morning that he had taken in \$700 the day before.

Q. They complain they do not get employment in these stores. I was wondering why they do not experiment in the conducting of stores of their own.—A. They have not the capital to go into business and employ clerks as the whites. It would pay some of you who are wealthy to put up the stores and try the experiment and help us along.

Q. (By Senator KYLE.) Is it not true that it requires generations to develop a business instinct?—A. I said it was because of lack of ability. The changes have been so great; we have only had this opportunity for the last 35 years and

you have had it for ages, and you know when we overtake you there is no other fellow before us.

Q. Is it not the proper thing to instill into the mind of the colored people that when they resume the vocation of agriculture it is one of the most exalted on the face of the earth?—A. Forty-five per cent are farmers, and since God took man from the earth and told us to get our living out of it, and we will go back to it when we get through, I would rather stick to it.

Q. I agree with you, and would apply exactly the same rule and principle to the white race as to the black. I think our white people would be better off if they got out into the land instead of huddling around the cities.—A. But you will find the disposition and the tendency of the colored man in this country is that of the other men who have been making toward the cities. With all the rich land that we have in this country there is no reason why every man should not have a home and do well.

(Testimony closed.)

WASHINGTON, D. C., February 2, 1900.

TESTIMONY OF REV. M. B. SALTER,

Bishop, A. M. E. Church.

The commission met at 1.30 p. m., Mr. Clarke presiding. At 3 p. m. Rev. M. B. Salter, Bishop of the A. M. E. Church, was introduced as a witness, and, being duly affirmed, testified as follows:

Q. (By Mr. CLARKE.) Will you proceed to make a statement or do you prefer to be interrogated?—A. Either.

Q. I would like for you to go forward and state in your own way what knowledge you have to impart to us concerning education and industry in the South.—A. I am pleased to say that the statement made as to the education of the negro being a curse, I believe to be false. I believe that the education of the negro is lifting him up, bettering his condition every day, and making him a most valuable citizen. I think if justice were given him and laws thrown around him properly, there would be no occasion for this agitation and this unpleasantness that seems to be now existing.

I believe the negro should have an industrial and higher education. His head should be as much cultured and educated as his hands, and I believe that if the law were so arranged and thrown around him properly he would make a good citizen. I do not think that you have a truer people living among you than the negro race. You find no traitors. He has been true to the flag, and is true to the country to-day; and all he wants is justice and fair play. He asks for a man's chance, and for a chance to pass through this land undisturbed and unmolested as other men are allowed to pass. We ask for nothing more than you give the Italian, the Greek, the "dago"—simply a man's chance. I think, further, with the encouragements thrown around us that should have been thrown around us there would be no unpleasantness. We feel grieved by your State laws. We feel if the United States Congress could so enact or arrange to put its finger on those States that make these iniquitous laws, it would be sweeter and pleasanter.

We feel grieved to know that you have your Jim Crow arrangement, and that ourselves and our wives and our children are forced to pay a full price for a ticket, and are forced to ride with criminals, murderers, drunkards of your race as well as the negro race. Give us fair play and we will give you no trouble. We have given you none, and will continue to give you none. You will find, I think, that there has been a great deal said about the morality of the negro that is false. There may be bad negroes among us like there are some bad white men among you. There has been a great deal said about the negro being a rapist. It may be in some instances here, there, and yonder; but it is very easy sometimes for me to turn as black as black can be, but it is hard for the black man to turn as white as I am. Give us justice and see that we have all the rights, and you will find us true. I think I can say for the negro he will go as far down in the dark places to rescue and protect your women, if you will give us right and justice, as any man on the globe. He is true; he is moral. There has been a good deal said about the morality of the negro. He marries now. Once he could not marry; but he marries now, and of it you have an example possibly if you look at me. He marries now, and you will find very few bastard negro children, very few of them; and I think the marriage percentage among us is exceedingly great.

The negro is as honest as the common run of men, all things being considered. He is owning his home and his land whenever an opportunity affords itself. He lives in nice houses and worships in nice churches. One-half of us are living in good circumstances. We have our land and our houses, and sometimes our carriages, and our horses, and our cows, and our waiters, and we are living very nicely. I think we have been misrepresented somewhat by saying that education is a curse; that it has not blessed us. I think it has blessed us largely and is destined still to bless us more.

Q. Is there a desire among the people of your race for social equality with the white race?—A. I do not think there is, because we have three colors among us, and we are better off than you. We can marry the mulatto woman that is pretty, and the Indian-looking woman that is handsome, and we can marry the black woman. So there is no desire on our part to marry into white circles. We are disposed to ostracize the negro man who would ostracize our women and go and marry one of yours.

Q. Is there any prevailing custom or habit among your people to make themselves offensive to white people in railway cars or other public conveyances when seated together?—A. That I have never seen. That I do not think is so. There may be some exceptions, but I have never seen it. Until the States passed the Jim Crow law, I have never seen a negro offensive in a first-class coach; yet there may have been occasions, but I have never seen them.

Q. Did you hear repeated the statement of one of the witnesses before the commission to the effect that one-third of the race has advanced since the civil war, one-third has remained stationary, and one-third has deteriorated?—A. I heard of it.

Q. Do you believe that to be true?—A. Individually, I do not believe that to be true. Two-thirds of them have made rapid strides. There may be a third that possibly have not made the progress that they should have.

Q. Are you familiar with the conditions of the negroes on the sea isles?—A. Somewhat. I am.

Q. Have they deteriorated?—A. I do not think so. Visiting them, as I do at times, finding them owning lands and owning their homes there, their horses, mules, jackasses, and cows. I do not think they are going backward.

Q. Do they all speak the English language, and speak it so that it can be understood by others as well as by themselves?—A. Of course, on the islands it is not supposed that they should be as grammatical as those in the cities under a different atmosphere, but anyone can understand the negro when he speaks on the islands.

Q. (By Senator KYLE.) What islands?—A. The sea isles, he asked me. I would suppose you mean such as Beaufort and James islands.

Q. The sea islands along the coast of South Carolina.

(Interruption by another bishop.) I would like to ask if there is any perceptible difference between the brogue or speech of the white people of that section you refer to, the sea islands, and the colored people there?

The WITNESS. If you simply put on a dark veil you can not tell the white man from the negro as far as his brogue is concerned on these islands.

Q. (By Mr. FARQUHAR.) I would like to know what is the practical condition of the negro down there, what opportunities he has to get a living; that is, is it not worse than it was, or what are the chances, and what are his opportunities?—A. I can say that it is not directly worse than it was. The negro is willing to work, and ready to work, and does work faithfully when the opportunities are given him.

Q. What is the system of payment on these plantations?—A. Tickets.

Q. Could they not get along better if there were an improvement in the method of payment?—A. If they could get their wages in currency or in silver, most assuredly.

Q. Do they ever get it?—A. No: not always. If a planter owes a negro \$1 he pays him 75 cents in checks or tickets and maybe 25 cents in money. Sometimes he pays him \$1 in checks and has him buy from the store.

Q. (By Senator KYLE.) These checks are given upon stores, are they?—A. Yes. For instance, one will have a plantation and have 500 negroes working for him, and pay them in checks.

Q. You think that is an advantage to the negro?—A. By no means.

Q. That is from your observation?—A. Yes.

Q. Did you ever get your missionary money in checks?—A. Yes; as high as \$10, and on one occasion when I had the honor of bringing you [speaking to Bishop —] \$1,400, one-half of this was in checks.

Q. (By Mr. CLARKE.) Is that method of paying provided for or in any way recognized by the laws of South Carolina?—A. Well, I can not just answer that; I do not know. It is not as a rule, but it is just where plantations are owned by one's self.

Q. (By Senator KYLE.) The same precisely that we now have to contend with here in Pennsylvania, and all throughout the West among the white people—what they call "company stores," where the miners are compelled to buy of the company stores?—A. Yes; I think that we could be encouraged more than we are, as I said before, in such things as the iniquitous Jim Crow business, if that could be enacted out, and a strong arm put around us, and if that were done I would be glad.

Q. That is directly bearing on State legislation, is it not?—A. Yes.

Q. Can you suggest any national legislation for colored people?—A. Well, I wish our Congress could enact a law so that the large amount of the money that they have got laid up unused could be given to the South, and that there could be larger schools, and have higher industrial education as well as other education; I think that would be very helpful.

Q. The large amount of money the colored people have laid up, you mean?—A. No; that you have at waste, laying around resting. I judge there is quite a bit of it up here resting.

Q. (By Mr. CLARKE.) Have you made any observation of the employment of your people in cotton factories?—A. Well, yes. Here recently we have a cotton factory in my city. The negroes are working in there, and are making nice, excellent headway, but the poor white people are not pleased with it; but the owners of the factory are keeping the negro, so far as justice is concerned, in the factories, and they are giving good satisfaction.

Q. Are all the employees colored?—A. Up to the time I left there they were all colored.

Q. And they operate the same kind of machinery as the white operators?—A. Yes; they do. The white foreman thinks they are better workmen than the poor whites, what we call "crackers;" anyway they announce them better workers than the whites.

Q. Do the negroes work any more hours in a day?—A. No; just the same.

Q. And these factories, so far as you know, are conducted on precisely the same principles, and under the same rules as the factories where white people exclusively are employed?—A. Yes.

Q. (By Senator KYLE.) Is this system of paying in checks in vogue in factories as elsewhere?—A. No; they pay in money in factories.

Q. In money entirely?—A. Yes. The check system is only on plantations.

Q. Is that done on plantations in the South?—A. As a rule.

Q. In all Southern States?—A. Well, I can not say that. I only speak directly of South Carolina.

Q. Is it not the custom throughout the South to rent tracts of land to colored people?—A. In my State they rent and sell. As to the other parts of the Southern States I can not tell you.

Q. So in case they rent the land they get the crop themselves and can dispose of it as they wish?—A. Not directly so. If I own 100 acres, and I rent it to you, you would possibly have to give me two-thirds of the crop. I would rent it in that way. Very seldom it is rented for cash. He takes my 100 acres and of the number of bales of cotton that the negro could raise, say 100, I take 75 and leave the negro 25. Maybe he is so largely in debt that when he sells out he has not even the bagging left.

Q. The question, of course, as to the rental of such farms depends upon what the property owner furnishes and the tenant furnishes?—A. Sometimes.

Q. In my State we have white men who rent land according to this proposition: The owner of the property will furnish the land and the seed, horses, and the farming implements, and will get two-thirds of the crop; the tenant who does the work gets one-third of the crop.—A. Sometimes that is done; other times it is not.

Q. Then we have of course done the other way—the tenant furnishes machinery, horses, and seed, and then he gets two-thirds of the crop, and the owner one-third.—A. We do not work it that way.

(Testimony closed.)

WASHINGTON, D. C., February 2, 1900.

TESTIMONY OF REV. W. E. DERRICK,

Bishop, A. M. E. Church, Jackson, Miss.

The commission met at 1.30 p. m., Mr. Clarke presiding. At 3.26 p. m., Bishop W. E. Derrick, of Jackson, Miss., was introduced as a witness, and, after being duly affirmed, testified as follows:

Q. (By Mr. CLARKE.) Will you proceed in your own way to make a statement, or do you prefer to be interrogated?

The WITNESS. I am pleased to be present to confirm the statements made by the preceding bishops. After a period of a number of years in the city of Jackson, Miss., and Little Rock, Ark., I have discovered the great trouble to-day is that if the color of the man's skin could be abolished and the question of justice stand out there would be no trouble. The racial trouble is common because the white man hates the negro. Having been his servant and slave in bygone years, there is an affinity between people in that section of the country; yet the spirit of the Anglo-Saxon we know is that the dark races must be subservient to him. The negro of the South to-day is keeping pace, and if he only gets a chance he will convince even those who question his ability that he is somebody. For instance, it has been said that his moral status is of that nature that he would not be admissible in society. Suppose it is so. It is unjust for him to be held in that light; it is not warranted; and if we withdraw the curtain, negroes' morals have improved, do improve. On every side it is to be seen; it is becoming strong; he is becoming a more respected member of society. Why? Because the schools and churches have improved him, or, if it were not so, there would have been failures in their attempt. The educational status in the South challenges the admiration of all. There are 170-odd institutions of learning supported by the State, by the philanthropists of the North, and by himself. Over 38,000 students are in the higher branches, in colleges and seminaries. You see more than 1,000,000 scholars in the primary schools. The Southern States have paid out in the past 25 years over \$75,000,000 for their education, which is an evidence that if there were failures, these legislatures of the South would not be scattering and wasting their money.

As to his agricultural status in that country, he is the bone and sinew of the South, and I believe to-day the man who attempts to encourage his emigration would die. Farmers and citizens of that section would go at that man quicker with Winchester than they do for rapers. A very able-bodied negro is worth \$1,000 a year in the South, and it is realized and acknowledged. He plants the cotton; he gathers it; he gins it; he bales it; he ships it; while the white man's money furnishes the implements and the seed, yet he furnishes the labor. He is owning his home. There are thousands of homes in the Southland that reflect credit on any people, regardless of color or nationality. There are no longer but 2 rooms or 1 room; there are cottages with 5, 6, 7, 8, as high as 10 rooms to be found, and numerous so among the people.

Q. (By Senator KYLE.) Are these large better houses in the cities or on the farms?—A. They are in the cities and villages.

Q. Do the colored people on the plantations still live in a primeval state?—A. Well, they are compelled to, if they are under the contract system; not because they desire to do so.

Q. Well, those living in the cities, in the better houses now, have abandoned farming pursuits and gone into some other lines of business?—A. A large number are still farmers, owning farms, and coming to the cities like other gentry.

Q. Own land in fee?—A. Yes.

Q. What is the extent of the farms as regards the acreage?—A. Some have farms of as high as 1,100 and 1,200 acres.

Q. They take up the abandoned lands of the South?—A. They are, like the trees, taking roots and going down.

Q. We have been afraid for a number of years in the North here that the Holland Dutch and German peasants abroad might come in and embrace the rich opportunities of the South in getting cheap homes. They are entitled to them if they can get them.—A. The negro is holding them.

Q. If they once do that, then this contract system of farming under lease will cease, will it not?—A. Yes. In some places there may be hostility, and it emanates very largely from the spirit of competition and jealousy. As long as the negro remains down there is no friction; as he starts up there is antagonism.

Q. Does that not grow out of the former relations between the whites and blacks there?—A. That is just what it is. The fact is that radical prejudice dies slowly. I am not a Southerner; I am a foreigner; and the white man and the black man are the same to me. Do not suffer this bronze face to bother you because you are a white man. I have taken that stand. The negro must cultivate character. My conservatism may not be just the thing for the masses, but I have long learned that conservatism is the best element of all success. What I would impress my white brethren with is this: We ask them to discriminate on the ground of the character and not the color. A bad white man and a bad black man are both bad fellows. The man that is a gentleman is a gentleman regardless of color. But the South has not got there yet—not even your North. We do not expect to force into them measures in 30 years that have been taught to the opposite for 250 years.

Q. Is it not true of the South that the colored people, upright in character, honest and industrious, are treated as fairly as any class of people?—A. In certain sections.

I am occupying your chair, gentlemen, with no feeling on the color question. That is honest. If there were two men approaching me, one a black and one a white man, both hungry, and I only had a single penny, I would not give that penny to the white man and ignore the black man, and I would not ignore the white man, but I would take my penny and buy a loaf, and feed both. Therefore, when I speak of the South, there is no feeling with me. I am telling a living truth. In the South the conditions of both races need to be better, and it can not be accomplished by preaching incendiary sermons and making utterances of antagonism. The South is the negro's home as much as the white man's home. Both men live there in peace, and what we want to impress the Southern white man with is that goodness is goodness, and when the good element of both races combine, then the evil elements will go down, but as long as they insist on amalgamating the good negro man with the bad negro man, because they are negroes, then comes the friction. We only ask recognition upon merits, and it is stultifying the white man's conception of justice, sending us in schools and spending their millions to educate us, and then in spite of all education we are humiliated. It is better to keep negroes in ignorance than to allow their eyes to be opened and then say, you can not enjoy the things of life.

Q. Is it not true that one generation has got to suffer the curse of another to lift the balance up?—A. We accept that as true. We accept all to be true you say. My argument is that we are not preaching incendiary speeches, nor sermons. Where is the incentive for this education? Is this your civilization? Is this your religion? Not that we hate the white man—God forbid! We do not hate him, but we only ask him to give us room. There are negroes who could not come in my kitchen, and there are white men. All we ask is that you treat us upon our merits. I passed through Texas once; went to Dallas. I went to a lunch room to get some lunch, and the proprietor looked at me and said, "Well, you can go back among my cooks." I said, "I have cooks and servants in my home in the North—New York." He said, "You are not a 'nigger,' are you?" I said, "No; I am a gentleman." He said, "Henry, accommodate that man." He accommodated me.

As one bishop of the African Methodist Episcopal Church, we are willing to give all information without bias in this great matter, for we are conscious of the fact that this is our home, and we are going to stay here.

Q. (By Mr. KENNEDY.) There was before the commission some months ago a man who represented a community in Alabama, something of the nature of Booker Washington's. He said they were trying to build up a farming community and industrial community for the colored people, and that they found difficulty in getting title to land; that old landowners would not sell them land. You spoke about the colored people having farms and homes in the South. I would like to ask you if you find any difficulty in acquiring title to those farms and homes?—A. In certain sections they find it, but not principally because they are colored people; there are certain real-estate sharks who will do any class of civilians.

Q. Are there not people like that in every community?—A. Yes; they were needed somewhat, probably. The colored members did not want to have them settle in that section. Neither do I believe in too much gathering in a way like amalgamating business centers. There is something you have got that I want to get away from you and I can not get it.

Q. If they have money they can readily acquire title to lands?—A. Yes. In the State of Alabama, I think in Uniontown, there is one colored planter who runs 50 places. I met an old cotton farmer at Union Springs who makes 100 bales of cotton on his plantation, and at East Montgomery one who owns fully 1,500

acres; and in Delta, and all along the railroad centers of the Illinois Central, there is no trouble in securing title to the land.

Q. (By Senator KYLE.) Have the colored people in the South taken to colonizing in the Northern States? Of course it was done in Kansas and Oklahoma and all around. Have they taken advantage of the homestead laws of the United States very extensively?—A. No. Neither is it advisable for old trees to be transplanted. The boys and girls from the colleges and schools, we would advise them to seek outlets; but the old families, it is better for them to go on. We do not think it is wise to go in large bodies. I think there are fifty or one hundred thousand in the Western States that confront them now; and it is only a question of give us a chance in the Southland. This trouble, I repeat, emanates from the fact that we are developing. Had we remained down, there would have been no trouble at all. It is a good deal like crabs—as long as you leave them alone they are all right, but as soon as you disturb them they start up. For instance, young white men in the South used to practice medicine and law among the negroes in the olden time. He has lost his job by the young negro doctors coming up. We find we are furnishing our own merchants for all these things, and it comes in their way, and now this thing must be stopped. The reason why he crowds the city is because he has no property in the rural districts, and he seeks the city for protection. Those larger cities of the South are cities of refuge for the negroes. That is the whole secret. Give him proper police protection and he will not crowd your cities, for he believes in agriculture. That is the secret of the whole thing, and I am pleased to state that in Mississippi "there is a crack in the dark." The inaugural address of the recent governor indicated to us that there is a resurrection and a better expectation of civilization when he told his members of the legislature the other day that this lawlessness must be stopped, and that the negro has been such a factor to the South that the Southern commercial prosperity is largely attributed to him—his cotton, corn, rice, and sugar, from which the white man gets rich. He goes further. There was attempt to secure school funds from the tax paid by the negroes which was to be used for negro education, and the tax paid by the whites for white education. He said that could not be done; that these people are not in condition yet to produce revenue enough to support them, and it is better for us to keep schoolhouses open than to have penitentiaries and jails.

Then another thing in the South which this commission would do well to emphasize in their report, and that is the present condition of the South. What we need and what we beseech the authorities is to get boys' reformatories in the South. Juvenile offenders in the South are sent to prisons and penitentiaries, and they are brought in contact with inveterate criminals, and in place of those boys and girls being reformed, when the time expires they are worse than ever.

Q. What you want is something similar to a boys' reform school?—A. That is what we ask the States to do.

Q. You have those in the South?—A. Nothing of the sort.

Q. They are breeding criminals?—A. Yes.

Q. The industrial schools are supported by the white people?—A. Well, they try to get it for themselves now.

Q. What I know is from conversation with Southern gentlemen in Congress. They have all spoken in the highest terms of the negro where he has taken up industrial lines—similar to those which Professor Washington teaches—and I can see, as you indicated a moment ago, hopeful signs in these things. There are men who a generation ago would have looked with disfavor on any form of colored education.—A. It is a hopeful sign. The very hands that would have whipped a man for teaching the negro are to-day the very hands that are teaching the negro. This is evidence that there is a crack in the dark. Yet it is well to have agitators among us.

I think the South would be better, very much so, if the nation would adopt the old Senator Blair bill. Resurrect it and give those States some of the nation's money to assist them. By that being done it would assist. However, I believe the South is doing the best she can in the way of supporting the schools. They are doing well, considering they came out of a war stripped of all resources, and have already spent nearly \$100,000,000 for negro education. Now, if the Southern Representatives themselves would assist the friends of progress and education in the West and the North and give to us that bill—give us the money—but some are apprehensive that if it becomes a law it becomes a national fund, and that they would have no right to discriminate in favor of the colored students. We do not want that. All we ask is to give us the money and we will educate ourselves in that section. It is better for the negro to-day in the Southern country to be taught and tutored by efficient negro educators than to be taught by white educators of

the South, for they are not prepared yet to take the negro youth and tell him, "You are not as good as other boys;" therefore if Congress would pass a national educational bill, appropriating money for educational interests of the South, and the negro would largely receive his share, it would give us better facilities, and it would be better for all; but, after all, the training of the mind is the whole matter.

Q. That is on the ground, you think, that certain States and Territories are not able to look after themselves?—A. No. For instance, some of the Southern States are only able to give 4 months' schooling, some 5, and some 3. I do not think some of the States can give the youth in the rural districts over 6.

Q. You have not access to the State University in the State?—A. No; only those that are prepared for the colored children. Mississippi has given to the colored people a school at Alcorn, supported by the State. Arkansas has one at Pine Bluff, for which the boys are trained.

Q. You have no State agricultural colleges?—A. Upon application; and in Mississippi on a small scale.

Q. Does not the United States, under law, help agricultural colleges in the several States of the Union?—A. I suppose Mississippi supports that movement for the education of the black, but of course it is limited somewhat. I was in Texas some years ago and talked with the superintendent of education at Waco, and he informed me it was his purpose to build a school for the colored youth, as all other cities of Texas afford. They pay better salaries to the teachers of colored youth than any other State I know of.

Q. It is pretty hard to pass a bill of that character in Congress, with most of the members feeling, as a rule, that educational matters are of the State rather than of the nation.—A. That is my opinion. That would better our condition, and I appeal to the fairness of your country, and not special laws. There is light ahead. It can not be any darker. The night is behind us.

Q. (By Mr. CLARKE.) Do you believe that the condition of the colored people anywhere in the South is worse than it was in the slavery days?—A. No, no, no, no. Let me be a free savage in a suit of indigo rather than to be a slave in silk and satin. No. The condition of the black man in the South to-day is a thousand times better than when slavery existed. The schoolhouses, the homes, and the churches are evidence of progress and of a higher civilization; and while there are frictions, and will be frictions, yet all I want to ask is that we have laws to protect us in our rights and privileges, and I think there is going to be a paddling of the canoe that will be quite successful. With respect to the testimony of the gentleman mentioned by Mr. Kennedy during the examination of Bishop Gaines, I suppose the spirit of General Armstrong became somewhat worried when he made that expression here. Yes; he made a mistake. His heart was right, but it was a mistake. He never intended to have said that, for among every people there are grades and principle, and there is not a negro to-day who occupies so low down a place in the scale of civilization as he did when he was the property of somebody else. He did not mean to say that.

Q. What is the growth of the percentage of literacy among the race as a whole?—A. Well, it is diminishing.

Q. Literacy, I said.—A. Illiteracy is diminishing. In 1860 we were almost illiterate. In 1870 we got down to 90 per cent; in 1880 we got down to 70 per cent, and now we have about doubled our population in color. In this very city, which is a Southern city, it is reduced to 35 per cent. That can be verified right in your Bureau of Statistics here. It is a matter of statistics. It is not hearsay. The figures refute the assertion of the gentleman quoted. In 1860 there were 4,500,000 of us. To-day there are fully 9,000,000, and we have reduced our illiteracy down to 50, and in some places down to 40, and in this very city, which was once a slave city, we are now down to 35 per cent. What we want people to know is that color cuts no figure; and it is unfair for Representatives to come here and make such unkind thrusts.

Q. (By Mr. FARQUHAR.) I think the gentleman stated that some of the troubles came from intemperance, and every man knows here that that is the curse of the negro in the South, and North too.—A. In the State of Mississippi there are 34 dry counties, and 30 of these are black counties and the others are white counties. The question of intemperance is a curse to any race. The trouble is this, you fail to judge us aright. They forget the man who comes into a store and selects the most inferior article and brings it in and says, "Here, this represents the best in that store." We are continually held up to ridicule before this country. We are held up by our thugs and our questionable characters. There are others, and the friends of liberty have no need to regret having struck the shackles off.

(Testimony closed.)

WASHINGTON, D. C., *February 13, 1901.***TESTIMONY OF PROF. W. E. BURGHARDT DU BOIS,***University of Atlanta.*

The commission met at 2.08 p. m., Mr. Phillips presiding. At that time Prof. W. E. Burghardt Du Bois was introduced as a witness and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your name and address and occupation to the stenographer.—A. W. E. Burghardt Du Bois, Atlanta University, Atlanta, Ga.

Q. (By Mr. CLARKE.) How long have you been connected with that institution?—A. This is my fourth year.

Q. Had you been engaged in educational work before going there?—A. Yes. I had been teaching since 1894. I taught nearly three years before I went there.

Q. Where did you graduate?—A. I graduated first at Fisk University, and then went to Harvard and graduated there in 1890; was there in the graduate school for two years, and then went to the University of Berlin and studied some time there.

Q. What is your chair in the Atlanta University?—A. Economics and History.

Q. Are you familiar with the educational, industrial, and social conditions among the negroes in the South generally?—A. Well, rather familiar. In our work at Atlanta University we conduct every year an investigation of some sort. We take a small subject and by means of correspondence through the South make an investigation, and I have charge of these investigations. Then, besides that, I have done some special work for the Department of Labor—some special statistics or studies in small communities. So my knowledge of conditions in the South is based mostly on these local studies.

Q. The commission will be pleased to have you proceed in your own way to develop this theme.—A. My idea has always been that in order to really get at the South and carry out any theories we ought to have a very careful basis of fact. It has usually been taken for granted that a man who has been born in the South, or born black, for that reason knows a great deal about the negro question. That is so to some extent, but it is a matter of opinion largely, and it is not supported by a basis of fact to which people can refer. Now, it has been my object to try to supply in a small degree this basis of fact.

My first work of this sort was at Farmville, in Virginia. The Commissioner of Labor was going to start some studies of the negro problem, and I wrote him asking if I could do some work. He said he was not quite sure, but that if I would go ahead and make an investigation in Farmville, Va., the Department would look over the manuscript after I had worked it up and see what it was worth.

What I did in that case was to go to a typical town and settle down there for a time. I made a census of the town personally, went to the house of each negro family in the town, and besides that tried to find out just as much as I could about the general situation of things in that town. The results of that investigation have been published, but I want this morning to give you the results of another similar study in Georgia.

In the first place, I presume you are familiar with the fact that there are more negroes in Georgia than any other State of the Union; that the growth there of the negro population has usually been larger than the growth in general through the United States. There are to-day over 850,000 negroes in the State. Down in the southwestern part of the State there is a county called Dougherty County. I have a map of Dougherty County here, which you might pass around. [Here the witness passed map around for inspection.] As you will see, it is a little county, about 10 or 15 miles wide and perhaps 20 or 25 long. I went down there in the summer of 1898—I think I am correct about that—and spent 2 or 3 months there, with 2 or 3 assistants. We visited nearly every colored family in the county. Most of them live out in the country districts. Then at one point in the county there is a town called Albany, the county seat. In that county there is a population of about 10,000 negroes and about 2,000 whites—to be exact, there are 10,281 negroes (that was in 1890) and 1,975 whites. So, you see, it is a black-belt county. I have traveled 10 miles down there without seeing a white face. I think the disproportion between the negroes and the whites has not been kept up in the last decade, but that is my personal opinion. I think there are more whites in proportion than there were 10 years ago. The county was first laid out

as Baker County, and part of that was afterwards set aside and called Dougherty. You have there a chance to study a community of negroes. It has had a rather interesting history. It was called the Egypt of the Confederacy. It was back from the main line of approach, and Sherman's army, left it to the right as it came down, and a great many of the negro slaves were driven down there for a place of refuge from Savannah, Macon, and other parts of Georgia; they were held there, and after the war they settled there. It was a sort of huddling for self-protection, a thing that has very often occurred in the South. It was not purely an economic movement because the negroes saw they could do better there, but because by huddling together like that they got a sort of protection that they otherwise could not get.

In Baker County and a few others in that section, even to-day, if a stranger should pass through that county he might be stopped anywhere on a crossroad and asked who he was and what his business was there. Baker is a county that had poor land and was settled by poor whites. They had very few dealings with the negroes, and vice versa; and the relationship between the two races is not at all pleasant. In Dougherty County you have the old master class, and these and the negroes come in closer contact, and on the whole the relation between the two is very pleasant. Some of the descendants of the poor whites have come in and have formed a little disturbing element, but perhaps the largest disturbing element is one that is spoken of but little in the study of the South, and that is the Jewish merchant. I want to speak a little later in that connection of what he has to do with the situation.

Now I want to say a few words as to the character of the negro population in Dougherty County. I have figures here, and if I do not go into them enough in detail, if you will ask me questions I will be glad to answer them.

Q. (By Mr. LITCHMAN.) Why do you take Dougherty County as a sample?—A. I took it for two or three reasons. In the first place, it was a black-belt county, with about as large majority of negroes as any county in Georgia. In the second place, it was a county I could cover in the time I could give to it. There are other counties in some respects more interesting. There is Liberty County, for instance, and some other counties in the southeastern part of Georgia which are as interesting, and perhaps more interesting; but they are larger, and in the time which I had—summer vacation—I could not cover a large county like that.

Q. (By Mr. PHILLIPS.) You made a personal inspection for the purpose of ascertaining conditions?—A. Yes. I wanted to get a group of people divided off so I could get some of their history and find out as much as possible about their life and general conditions.

I studied in that county—that is, we put down on our schedules—6,093 people in all out in the country. There were others in town that I will speak of later, but in the country districts there were 6,093—about 3,000 males and about 3,000 females, a few more females than males. In the cities and a great many of the country districts there are more females than males in the negro population. The males go off where they can get more lucrative employment at this, that, and the other. They go to Florida and Alabama, and work as waiters and hostlers, and at bartending and industries of that sort; so you have a slight excess of females, though not nearly as large as in cities like Baltimore and Philadelphia, where the excess leads to many irregularities of life.

Then, as to the age classification. There is one thing to be noticed here, and that is, there are more children under 10 years of age than there are in the United States generally, or than there are in Germany, for instance. In the United States the proportion is 24.3 per cent under 10 and in Germany it is 24.2. Here in Dougherty County it was 27.2, showing a larger proportion under the age of 10. There is nothing else particularly to be noted in the age classification.

As to the conjugal condition. Most of them marry early, but not as early, perhaps, as their fathers and mothers did, and yet a good deal earlier than in the country districts of the North to-day. Perhaps it would correspond to the country districts in New England 30 or 40 years ago. I might say, parenthetically, I was born in New England, and consequently had a chance of making some comparisons from that point of view. Practically all the people get married, but there is some irregularity in marriage relations, of which I will speak later under "Families." There is the old custom among the lowest classes of staying with a wife for a while and then separating and getting another, and so on. Sometimes these cohabitations without the regular marriage ceremony are practically permanent, so they amount to common-law marriages; but in other cases a man lives with one wife for perhaps 5 or 6 years, and perhaps less. This is not as bad in this county as it is in some other districts, but I should say about 8 per cent of the families through the country districts were cases of this sort. where

the cohabitation was for a comparatively short period—where they are liable to be broken up in anywhere from 1 to 5 years.

Q. (By Mr. LITCHMAN.) These families sometimes have children?—A. Yes.

Q. What effect does that have on the permanency?—A. It makes in all statistics, and especially in census statistics, a large number of widows. You will notice the preponderance of widows in statistics that have to do with the worst classes of colored people. That is true in a city like Philadelphia. Take the slums of Philadelphia, where there are a great many colored people that have come recently from the South; you will find a curious excess of widows.

Going from that feature. The birthplace of the people in this county illustrates the history of the county before the war. You will find most of the population, especially the population over 20 years—perhaps 10 per cent of them were born in the county and about 90 per cent were born in Georgia, the other 10 per cent coming from the border States and from Virginia. This part of Georgia was greatly affected by the internal slave trade. In the fifties they supplied negroes for the rich cotton lands of Dougherty and other counties near.

Now, a word as to the illiteracy. Of the persons 10 years of age and over, and we usually count those only in statistics, 73 per cent were illiterates; that is, they were totally illiterate, or they could perhaps read a very little, but could not write. I counted them all as illiterate, because it is very difficult in collecting these statistics about illiteracy to make any real good distinction between those who can read and write and those who can read but can not write; and those who can read and not write are practically as illiterate as those who can do neither. So, practically, 73 per cent are illiterate and 27 per cent read and write. Now the percentage of illiterates is somewhat less under age of 20; that is, about 60 per cent are illiterate and 40 per cent literate. Those under 20 show the results of the common school system, though the schools in Dougherty County are very poor. I saw only one schoolhouse there that would compare in any way with the worst schoolhouses I ever saw in New England. That was a board house equipped with rude benches, without desks, no glass in the windows, with no sort of furniture except a blackboard and three boards put together for a teacher's desk. Most of the schoolhouses were either old log huts or were churches—colored churches—used as schoolhouses. In the town they do have some very good teachers. They have an academy supported by the American Missionary Association where they have good teachers, but in the country there are very few school facilities. Then, too, one thing I noticed in the testimony this morning about which I think I might add a word. They have the same difficulty about the superintendents there. The superintendents are paid very little, and this has led, in some cases, I can not say how far, to hiring a teacher who will help to increase the income of the superintendent. Of course it is very difficult to get at matters of that sort. For instance, a man is put down for \$30 a month as teacher of a school. It is not always certain he has not made a contract with somebody, either the superintendent or somebody else, to pay a part of it for the privilege of being appointed. The result is that worse men get appointed than there would be if the superintendent could make enough by his ordinary salary to get along. I do not know how far this goes and I do not know that it is peculiarly true of Dougherty County. The man that told me of his own case was not speaking of Dougherty County, but it looks as though that happened a good deal in the country districts in Georgia.

Q. (By Mr. PHILLIPS.) How is this school money raised in Georgia?—A. The money for the public schools in Georgia is raised in two ways. In the first place there is a little by local taxation. Then besides that the poll tax, as in South Carolina, goes to the public schools. The State fund is made up of the poll tax and a number of special taxes. The State tax on liquor licenses yields considerable, and there is the income from the State railroad. The State owns one railroad and rents it, and half the rental goes to the public schools. There are several other taxes—the inspection of fertilizers and things of that sort. And that State fund is divided among the counties in accordance with the amount of direct taxes that they pay, and it goes to eke out whatever local taxation they may add to it. Very little local taxation is added. In Massachusetts the great bulk of the money for the public schools comes from the towns. It is not so in Georgia, the great bulk comes from the State. In the cities there is considerable local taxation for school purposes.

Q. Please state what railroad that is.—A. The Western and Atlantic, I think. I will not be sure of the name of the road. This railroad was started before the war, very largely by slave labor, and was finished after the war. It is a sort of white elephant on the hands of the State. Just now they want a new depot in Atlanta; the State does not want to build it and nobody else wants to build it as long as the State has an interest in it.

The most important thing about these people in Dougherty County is their occupation. The great mass of them are farmers and laborers. In the United States those persons over 10 years of age engaged in actual occupations form about 48 per cent. The rest form the leisure class, the housewives at home and the old people, and the children who are going to school. In Dougherty County 96 per cent are engaged in gainful occupations. That index shows the character of the population. There is no one left to really make homes. There is no time left for any afternoon of life—everybody is working. I do not mean by that they are all working hard. In the very nature of things they would not be; but it is just the vista of a man's life there of the same sort of toil year in and year out. One only has to go out in the country in a place like that to have his question answered as to why people go to town. The only curious thing to me was that more did not go than did.

Among the men 20 years old and over, there were 1,319 farmers and farm laborers, and of those engaged in other occupations there were 179. You see the great preponderance of farmers.* And among the women it is practically the same—1,341 farmers and laborers and 216 only in other occupations. Of those between the ages of 10 and 20 the disproportion was even larger.

I have these occupations in detail, but I will read just those of the men between 20 and 40. Farmers and farm laborers, 696; laborers in mills and cotton compresses, on railroads, wood cutters, etc., 31; watchmen, porters, and teamsters, 12; servants, 8; artisans, carpenters, blacksmiths, shoemakers, machinists, and engineers, 11; merchants and tailors, 6; teachers, 3; ministers, 10. Those are the men between 20 and 40, which gives an idea of how the men work in the prime of life.

Now as to the social classes. About one-half of one per cent are recipients of charity. They are mostly old people, that usually live out in the country in houses that some person has furnished them rent free, and they work around a little on a small plot of ground, but are practically supported by the charity of some neighbor. To some extent they are supported by the colored neighbors, but mostly by the whites. Then above these come 10 per cent who are croppers; and I am going to explain more in detail what I mean by this term. I put these two together, the 10 per cent and the one-half per cent, and call them the submerged tenth. They are below the horizon, so to speak. Then comes the great mass of the laborers, those who work on the share system, receiving part of the receipts—metayers—39 per cent. Then come the wage laborers who work for a fixed money wage; then the wage laborers who have houses furnished to them. Of the wage laborers there are 21 per cent, and of the wage laborers with houses 18 per cent. That is the mass of the population. Then above these come the people who have emerged—who have gotten out of the mire altogether and are really making and have made an advance. They are the renters and the owners. The renters are 4.6 per cent and the owners 5.7 per cent.

The croppers are the lowest in the economic scale, outside of the charity recipients. They are negroes who live on the plantations and are entirely without capital. They furnish the labor and the owner furnishes the land, tools, seed, and everything; and the crop is divided, the owner getting from one-half to two-thirds. If he has advanced supplies, of course that is taken out of the cropper's share. About one-tenth of the negroes labor in this way. It is not satisfactory to either party. The owner incurs a large responsibility and has only limited power over the labor. The laborer has nothing to lose and is not spurred to work under this system of advances, and the result is there is dissatisfaction on both sides. That system is being very rapidly changed to the metayer system of sharing crops and charges. It is interesting to see how a man falls into one class one year and climbs up and gets into another class another year. The year I was there was a year in which things were about as bad as they could be, because cotton sold for 4 cents at the time most of these negro farmers were selling their crop, and they were in poor condition.

Under the metayer system, a man goes to a landowner and makes a contract with him to take a certain piece of land. The laborer furnishes some capital. He usually furnishes a mule and some tools and something for subsistence, and the owner, on the other hand, furnishes the land. Just after the war he used to furnish the land, and also took care to see that the man who was working for him got his food and clothing, but the storekeeper came in and took that from him. He really drove the landlord out of the business of furnishing the laborer, and he drove him out because he could offer inducements to the laborer. He had a store in town, and the laborer wanted to get to town; he put his goods in an attractive shape. The man that has come in and taken the place of the white landowner, then, is the merchant; and in Dougherty County he is in many cases a Jewish

merchant. I should say nine-tenths of them are Jewish merchants. Some of them are Russian Jews, some German Jews,*but most of them are Polish Jews. They have come there with their thrift and their idea of driving a hard bargain, and they do a great many things that the white men of the South would not do. They have no objection at all to calling the negro "mister," and they are pleasant to him, and they never find any particular fault with him unless he is in debt. They keep the things he wants in the store, and the result is they do the business of furnishing these colored laborers. Their prices are anywhere from 30 to 100 per cent above the cash price.

For the land that the colored farmer hires he usually pays a rent in cotton. For 20 acres and house he would pay from 300 to 500 pounds of lint cotton. The average farm is usually 40 acres. That is called a one-mule farm, and they pay anywhere from 350 to 2,000 pounds of cotton, depending on where the land is with regard to market, and how good the land is.

He starts out, therefore, furnishing the mule and some of the tools, and the landowner furnishing the land and perhaps some of the tools, and he goes to work to put in his crop. Just as soon as the crop is up, and sometimes before the crop is up, he goes to town and gets credit from the merchant in town, and that merchant takes a mortgage. They give him a regular mortgage, and usually there are several little things put in that mortgage. In the first place, there is in Georgia, of course, the homestead exemption. There are certain things you can not sell if a man goes into bankruptcy, just as there are in other States. It is a pretty large list in Georgia—a very respectable list. But the man that makes a crop mortgage nearly always promises not to take advantage of that reservation, so that he signs away his right to keep anything. If you go down to Albany almost any Saturday morning you will find out in front of the court-house bedsteads, bureaus, stands, looking-glasses, and clocks, and all sorts of articles of household furniture being sold out. Some metayer has gone into bankruptcy and the store-keeper has seized his crop and his household goods. He has probably told him that it would be cheaper not to go to the sheriff and have to pay the sheriff's fee, and the negro has learned it will not pay; so he just brings his things to town and they sell them at auction. The man starts in as a cropper the next year with no capital at all. If cotton goes up and he is successful, next year he is a metayer again; if not, he sinks still lower and goes to town and joins the loafers, or goes to another county and gets some other sort of work. Of 475 metayers who held land in this way 281 had 40-acre farms, 82 had 80-acre farms, and so on it went up until there were 6 that tilled from 400 to 1,600 acres.

Now as to the rent. I tried to figure out while there just what proportion of the crops that these men raised went in rent. Of 59 farmers who made from 1 to 5 bales of cotton the actual total was 240½ bales. Their total rent was 75½ bales; so their rent was 33 per cent of their income. There were 18 farmers who made from 5 to 10 bales, and about 31 per cent of their income went as rent. There were 21 farmers who made 10 bales and over, and about 16 per cent went as rent. Of 161 farmers who made over 1,000 bales in the year 1898 they paid in all 241 of those bales as rent; that is, 22 per cent. Of course that is very high rent, and when you add to that the interest that they pay on goods they have bought on credit you can see in a bad year there is going to be practically nothing left for them. I am going to show you the balance sheet of some of these men in just a moment.

Now, above the metayers come the laborers who are working for a fixed wage. They may be divided into two classes: (1) The semimetayers, or those who receive houses and rations; that is, they have houses to live in and receive meat and meal and a small wage of from \$4 to \$8 a month. They are usually called contract hands, and work through the season for one landowner. Most of the white resident owners cultivate their land in this way. (2) The regular laborers furnish their own house usually. They always furnish their own food, and receive 30 to 40 or 50 cents a day on an average. They are young persons usually. They have not enough to marry on, so that if they do marry they become metayers. As long as they work for wages they can keep up, and do not have to set up an establishment. When they need a regular income they have to go to renting on shares.

The money renters I have called the first of the emerging classes; that is, the first which in the struggle for existence have made a distinct forward step. The fixed money rental calls for a good deal of foresight on the part of the man making a contract. It requires in nearly all cases that a man shall furnish himself with his supplies, and he can usually make a better contract and get better land if he can pay an actual sum of money down. There is a good deal of risk about it. In 1898 the money renters had come out rather badly because cotton had gone down, and they were left with the same money rental; while on the other hand

those renting on the share system, when the price went down the same amount of cotton paid their rent.

Of those who paid money rent there were 19 who had farms under 40 acres; 8 who had farms between 40 or 50; 5 between 50 and 100 acres; 1 from 100 to 150 acres; 2 from 150 up. For the 19 farms under 40 acres the total rent was \$352. That was an average of about \$18.50 per farm. Those from 40 to 50 acres the rent averaged \$41 a farm; from 50 to 100 acres it was \$72 a farm; from 100 to 150 it was \$100 a farm; and those over that \$175 a farm.

I now come to the class of landowners. There were 57 families who owned land in Dougherty County. I followed that back to 1875, so I got an account of the negro landowners for the years 1875, 1880, 1884, 1890, 1891, 1893, and 1898. I had to skip some of those years, because the data were not there, and I had to get what I could; but they were somewhere near periods of 5 years.

I have here something I work out from that which has to me great interest, and which I think would to anybody who understands it. I have tried to indicate the ups and downs of the negro landowner. [The witness produced a table showing the holdings of land by the negroes for this period.] That can be summed up in this way: There have been 185 colored men who have owned land in Dougherty County since 1875. Of these 1 held his land 25 years, 4 held their land 20 years, 12 held their land 15 years, 12 held their land 10 years, 41 held their land 5 years, and 115 held their land 1 year. Of course most of those who have held their land for short periods are still there, and they may hold it longer. I do not mean they have stopped holding land, but up to 1898 that was the record.

Q. (By Mr. PHILLIPS.) Are they white or colored?—A. Colored altogether.

Q. (By Mr. CLARKE.) Was that loss of land due to their lack of thrift or to fluctuations in cotton?—A. Well, it was due to both, but in just what proportion it is hard to say. There were some instances where it was due to carelessness, and there were other instances where it was due to lack of knowledge of legal forms, especially in early days. They got into difficulties about the title to the land, etc. Then there are other cases where the fluctuation of the price of cotton was responsible. There is more land owned now than ever before. In Dougherty County they now own 15,000 acres of land. If they had kept all the land that they have ever owned in the county, I have calculated they would own about 30,000 acres there now; that is, they have at various times gotten hold of 30,000 acres, but have lost half of it. Nevertheless, they own more now than they have at any one period.

The record of their landowning is interesting. In 1870 they practically owned nothing, or if they did it was in the name of white men. There was some land and property owning in Augusta and Savannah, but it was all held in the name of white men. There was some land and property owning in Georgia before the war, and it is rather interesting to know about it. In 1875 they owned in Dougherty County 752 acres of land; in 1880 this had gone up to 2,456 acres; in 1884 to 6,607 acres; in 1890, 9,238 acres; in 1891, 9,676, and finally in 1898 they owned 14,988 acres. The value of that land is \$63,000. The total value of all property owned by negroes in Dougherty County is \$194,000.

Q. Have you any figures to show the average real and personal estate to each negro?—A. No; it would be easy to get it from these figures, but I have not worked that out.

Q. (By Mr. PHILLIPS.) Is there any objection on the part of the whites to the colored people owning land?—A. No; but there are certain laws and customs that are taken advantage of by some men. As I said before, the relation between the white and colored people there is very good indeed. I went out to a man a long way from the railroad and asked him if he owned any land. He was an intelligent-looking fellow; could not read and write, but looked as though he was a hard worker and had some sense. He said, "No; he had not." I said, "Why don't you? I should think you would buy some." He said, "I tried it once. I bought some land of a man up here." I forget the exact amount he said, but I think it was 1,000 acres—perhaps not as much as that, but it was a large amount of land—and he started paying for it installments. He got it over half paid for when the man sold it to a Jew. The Jew said that he did not want to sell the land, but the negro said he had paid over half, and he had the deed in his possession. So they went to a lawyer in town and the lawyer took possession of the deed—said he had better not keep it because the Jew would get it away from him. He went on and paid still more to the Jew until he had it very nearly all paid for; and at last the Jew said he would not let him have it under any circumstances. He went to the lawyer for the deed, and the lawyer had surrendered it to the Jew. He said he did not own any land; that was the last of his land and the last of his money. That has happened in some cases. Just how much of that there has been it is difficult to say, but there has been some.

Q. (By Mr. CLARKE.) Did you interrogate him as to whether or not he had tried to assert his rights in court?—A. No; he never had. You see he had perfect confidence in the lawyer. Of course there may have been some technicality about it, but there is no doubt he had paid for the land; and the man who got the land is a man that owns land all through there now, and is noted for sharp practice, not only with colored people but everybody. Anybody making a contract with that man should be a very smart man or have a very honest lawyer to get ahead of him.

Q. (By Mr. A. L. HARRIS.) You say the colored man had the deed?—A. Yes.

Q. And the original landowner sold to the Jew?—A. Sold his whole estate, of which this was a part.

Q. Is there any law in Georgia requiring a deed to be recorded?—A. Yes; but in country districts they are very careless about a good many things of that sort. A good many colored people have lost their land because they have failed to look out for their deed, and lost it through their carelessness. This man may have been careless about recording his deed.

Q. (By Mr. CLARKE.) Did not his very conversation reveal his ignorance in such matters, and is it not a fact that the ignorance of the negroes is taken advantage of by dishonest men there?—A. Oh, yes. That is naturally the case where you have a class that is distinctively an under class. While nine-tenths of the upper class may treat them with consideration and be careful of their weaknesses, yet that class is, after all, at the mercy of the other tenth.

Q. (By Mr. CONGER.) Is it not quite probable that the paper which he described to you as a deed was in fact a contract for the land instead of the deed?—A. It may be. The only thing is, I am quite sure the man paid for his land.

Q. If he was making the payments on the installment plan, he would hardly have been given a warranty deed in the beginning.—A. Sometimes they do. They very often do that. If a negro has something and says he owns land, it gives him many advantages. So there are many cases where men have bought land and have the deed a long time before they have paid for the land. That complicates property statistics. There is property there which stands in the name of white men which is owned by colored men; on the other hand, there is land in the name of colored men, and they are paying taxes on it, that is not altogether paid for. Such facts vitiate all statistics of property to some extent.

As to the way in which these people live, the great mass of them live in 1-room cabins. I have indicated it this way: seven hundred and sixty-one families live in 1-room cabins, 560 live in 2-room cabins, 93 live in 3-room cabins, and 60 live in cabins having 4 or more rooms. The 1-room cabin is an abomination in every way, and the 2-room cabin is not very much better. Of course they live outdoors most of the time. If it were not for that you could prove more crowding in Dougherty County than in the worst of the tenement districts of New York. For instance, in this county there are over 25 persons for every 10 rooms of house accommodation. In the tenement districts of New York it does not go above 22 usually. Of course they have all outdoors, and they live outdoors most of the time, but as far as their house room is concerned, and in the winter, it is very bad indeed. Of course the moral effect on these 761 families is very bad indeed.

Q. (By Mr. A. L. HARRIS.) Are these log cabins?—A. A good many of them are log, but board cabins are taking the place of log cabins now. From memory I should say about half were log cabins.

Q. Have they any windows?—A. No glass windows; only a hole in the wall. That is so in most of the houses, except the houses which are owned by negroes, and there the window begins to appear, and the front porch and the L-room, etc.

Q. Dirt floor or plank floor?—A. Usually a plank floor; some dirt floors, but not so many. The 2-room cabin is not twice as good as a 1-room cabin by any means, because very often what is called 2 rooms is simply 1 room and a little lean-to in the back, which is used sometimes for a kitchen, usually for a sleeping room; sometimes a loft, which is really half a room. That was designated as an extra room here. There is no doubt that the negroes are wretchedly housed.

Q. (By Mr. PHILLIPS.) How is it in regard to cleanliness of those cabins?—A. They are not clean; there is no one to keep them clean. You see everybody is working—women out in the field during the day, and when they come home they are tired and they just sit down. There are exceptions here and there: in the case of owners the women do not work in the fields, and in case of some of the better renters they do not.

Q. Do they usually have stoves or fireplaces?—A. Fireplaces, always.

Q. They generally have a chimney?—A. Yes; usually a chimney, and it is usually a brick chimney. Sometimes you will find an old clay and wood chimney,

but most of them are brick. I do not believe they have many stone chimneys there, but they always have a fireplace. They do not know how to use stoves.

Q. (By Mr. A. L. HARRIS.) Will you describe the furniture?—A. Yes; there are usually one or two beds—in most cases two beds—and large beds which almost always look dirty, and then there is a large chest to put things in, with a lid to shut down; and chairs—a few chairs. That is about all in the ordinary average laborer's house—the beds, chest, and chairs. Of course as you go up that gets more and more elaborate, and in the better class of houses you find more store furniture.

Q. (By Mr. CLARKE.) Are there any tables or crockery?—A. Yes; tables—that is, the unpainted table 5 or 6 feet long. I do not know and I could not say so much about crockery, because I was very seldom in places where they were eating or stayed where they were eating. They usually have, of course, some utensils, but I do not know whether it is mostly of crockery or what it is made of.

Q. Do you know what the food consists of?—A. Yes; you can get at that very easily, because they will always get it on credit at the stores. It consists of bacon and corn meal. The study by the Agricultural Department as to the food of laborers in Alabama, so far as the food is concerned, compares with conditions in this county very well indeed. Of course, to their bacon and corn meal is added coffee and molasses, but the great staple is bacon and corn meal.

Q. How do they cook bacon and corn meal?—A. They fry the bacon and cook the meal in ashes in pones, and so on.

While I was going through the country here I tried to grade the people, and for that purpose I used a system of gradation which I had used in other places in Virginia. In the first grade I put people who correspond to the ordinary middle class of people in New England—good honest people who are getting along well, who are thrifty and thoroughly honest and without any trace of any immorality of any sort. Then in the second grade those who were getting on well, but usually did not own their homes; but were at the same time honest and upright people. In the third grade I put the mass of laborers—all the laborers that had no criminal tendencies and were not distinctly lewd. Of course, there were some I put in that third grade who as to morality would not pass in New England, but they were not bad people, and lewdness was not conspicuous. There were some of those I put in the third class, those that were cohabiting without the marriage ceremony, but cohabitation was practically permanent. In the fourth class I put all the rest; that is, the lowest grade of the loafers and a lot of laborers who change here and there—migrate here and there—and those that live in all sorts of loose relationships. Now, of the whole 8,000 in Dougherty County there were 8½ per cent I put in the fourth or lowest grade. The great mass of the people I put in the third grade; that is, 83 per cent—poor people, but fairly honest. Then in the second grade I put 5½ per cent—people getting on well who usually did not own their own homes—and 3 per cent I put in the first grade. That was about as definite a picturing of the conditions of the people there as I could make.

Q. (By Mr. PHILLIPS.) Has there ever been any tendency to race trouble there?—A. No; they have never had any riot there. Down below there they had a riot, at Camilla, after the war, where several people were shot. In Dougherty County they have never had a riot, and I think they have never had a lynching. There is not very much crime.

Well, now, as to the outcome of these persons after years of toil: In every case where I could I got an exact statement of just what the men had taken in and had paid out during the year. Naturally I could not get that from all of them. There were 1,300 families, and I got from nearly 300 families a statement of the income and expenditures which seemed reliable. It was based partly on written accounts, and it seemed to me it was worth taking. After 12 months' work there were 3 of these families of farm tenants who were bankrupt and were sold out by the sheriff, and there were 168 who ended in debt; there were 58 who cleared nothing—came out even, but cleared nothing; then the rest cleared something, as follows: Twenty-seven cleared less than \$10; 15 cleared from \$10 to \$25; 13 cleared from \$25 to \$50; 13 cleared \$50 and over. These are the tenant families, not those that own the lands, but this is the outcome of a year's work of 300 families. I have it here more in detail, but perhaps it is hardly necessary to say anything more on that, unless you have some questions on it.

Q. (By Mr. CONGER.) I understood you to say, earlier in your testimony, that this year was a bad year?—A. Yes. Now, if this had been taken this last year undoubtedly the thing would have come out much better than that.

As to the laws: The whole question of local government in Georgia, and the way things are, and what should be done to make the laws better than they are,

is a question hard to get information on, because it verges on political matters. Certain crop-lien laws ought to be changed. They are made now entirely in the interest of the merchants, and it gives them a grasp on men so that it is not at all an exaggeration to say that in the Gulf States in general most of the negro farm laborers are in an economic slavery which keeps just about as fast a hold on them as the slavery they came out of; that is, if a man once gets in debt he is bound under, and he can't leave the place. If he is in debt to a man and leaves the place he is arrested. As a gentleman said this morning, the negro never evades a debt; they do not. It is not altogether their fault; they can't. Then if they try and live up to their obligations the laws are so fixed that it is very hard for anyone to know just exactly what is fair, it might very well be possible to say of a great majority of the men who hire them that they are fair. There is a minority that is not fair. These people are ignorant. The accounts are kept almost entirely by the storekeepers, and the negro has practically nothing to do with his crop. If his cotton crop is mortgaged he dare not touch it in any way. The merchants who have the crop liens are spending nearly all the time riding around the country and watching the crops. When it is gathered it is taken to the warehouse, and the warehousemen and the merchants make the settlement, then pay the negro what is left; that is, the negro does not appear as the principal anywhere. And then, of course, he must raise cotton. There is no use of talking to him about diversifying his crop. He can't. If he is in debt the cotton is the only thing the merchant will take from him to pay his debt.

As to crime in this country, there were from April 1, 1898, to April 1, 1899, 191 arrests. There is no way of separating the white and colored arrests, but the sheriff assured me that nine-tenths of them were colored, and I think you can practically ignore the white race; that is, probably 191—nearly all of them—were colored. Now, these 191 arrests were disposed of as follows: Bonded to compel them to keep the peace, and released on bonds and not tried during that year, at any rate, 44; 43 were found not guilty; 17 went to the chain gang; 16 were fined; and 5 cases were settled out of court. For a community as large as this, and as largely under colored control, as most of the people have to be, this is a small showing for crime. The most serious crimes were 28 burglaries—that is, arrests for that—some were proved not guilty; 16 assault to murder, and 1 assault to rape. The others were miscellaneous—fights and things of that sort.

Q. (By Mr. CLARKE.) Were assaults for rape punished in any other way there than by criminal prosecution?—A. No; there has never been more than that one assault to rape that I know of. There was once, so I am told, in the county a boy that was hanged for rape. There was a long story about it. I could not give the date nor the time it took place. There had never been a rape there, from what they told me.

That finishes everything I have to say about the country districts there. There are some things about the town which of course makes another study, which I can answer any questions about, but it is hardly worth while, I think, to go through with it in detail.

Q. (By Mr. PHILLIPS.) What is the general penalty for the violation of this lien law, or if they sell or leave without paying their debts?—A. I do not know just what. I have not the exact laws with me, but at any rate it is rather serious. It is a misdemeanor; they can go on the chain gang for it; I do not know just how long, but certainly from what men tell me there was practically no escape for the man in debt, until he got lower and lower and lost everything—all his capital, lost his mule—he could do nothing but be a cropper; but of course plenty of them get away.

Q. (By Mr. CLARKE.) Have you made a study of the lien laws of the several States, North as well as South?—A. No; I have not done that.

Q. (By Mr. KENNEDY.) You say the negroes outnumber the whites 4 to 1 in that county?—A. Nearer 5 to 1.

Q. Are the county offices filled altogether by men of the white race?—A. Pretty nearly. The local government in Georgia is very interesting. There are several sorts of local government there. The old form of government was to have the county governed by three judges of the inferior court, it was called, I think—three judges; they were appointed by the governor, and then gradually in the back districts, where the plantations were far apart, people did not take much interest in it, and the work fell into the hands of a man, really the clerk of the court, who was called the ordinary, after the English court, so that up until the time of the war the ordinary in most Georgia counties was the man who had all the power in his hands, and who had to collect the taxes; but did nearly all the things that the New England town meetings would do. Where there were towns

of course that was changed, and people took things in their own hands; but in the country districts the ordinary had full sway, without restriction. After the war the ordinary was given back a great many functions he lost before, and that immediately took the government out of the hands of the people and put it in the hands of one ordinary, and he was usually a white man, and his method of appointment was changed so that he was appointed by the governor of the State or the judges of the supreme court. Then, as things got settled down in a county like Dougherty, for instance, the ordinary was given again simply his judicial work, and the other work of collecting taxes, etc., and attending to the roads was put into the hands of the county commissioners; but the county commissioners of Dougherty County are appointed by the grand jury, the grand jury is appointed by the judge of the superior court, and the judge of the superior court is appointed by the legislature, so that no negro ever gets appointed either on the grand jury or among the county commissioners, and of course has nothing to do at all with any of these duties.

Q. That is the way of selecting county officers in all counties in Georgia?—A. No. In Fulton County the majority of voters are whites, and they are elected by the people. In Liberty County—nearly all the negroes own land down there, and there the county commissioners were appointed by the governor about 20 years ago, and they have been appointing themselves ever since. The mayor of the town of Darien is appointed by the governor of the State. Georgia is very curious in that respect. It is in reality a collection of counties, and the counties are independent; they are little States in themselves and they have a great many powers, and the legislature has the right to give any county any sort of government. If a county has a big black majority they ask for a sort of government that does not go by majority rule. There are some colored officers in Dougherty County, justices of the peace and small officers of that kind.

Q. Elected or appointed?—A. Appointed usually.

Q. (By Mr. LITCHMAN.) By whom?—A. I think they are appointed by the judge of the superior court, but I am not just sure about that. This is another thing it is very difficult to find out—that is, they have no way of keeping the special laws of the legislature. No county has its own laws collected together, and you go to a county and ask how that county is governed and it is very difficult to find out. You would have to take up the laws as they were passed at the time the legislature was in session.

Q. Do the negroes of that county take any interest in politics?—A. Not very much. Some, I think, do. You see, a man who is getting along well down there, owning land and something of that sort, soon finds that there is no advantage in going into politics, and the man who is not getting on well is kept out of politics usually by various things. For instance, there is a back-tax law. You must have paid your taxes since a certain year—I forget what year—away back some 10 or 15 years ago. You may go and register at your registering place, saying that you have paid those taxes. If that is not challenged you may vote. If it is challenged you have to prove it in some way, and the result is that three-fourths of the negroes are not qualified to vote, and do not go there at all. There are some that take some interest in politics, and are very much chagrined because the rest won't take any interest. Some of them are very intelligent men.

The whole machine is in the hands of one party. On the whole, the county is particularly well governed. There is some complaint about the government among both white and colored, but it is fairly well governed. They have built pretty good roads; I found better roads down there than I have found in some counties in Virginia—some rather prominent counties—but the sheriff, I know, was a man who did not seem to represent the best element of the county at any rate; but most of the officers seemed to be a pretty good set of men.

Q. (By Mr. CONGER.) Was this sheriff appointed or elected?—A. The sheriff—now, let us see; now, he is appointed by the grand jury, I think. I may be mistaken about that; he is not elected, at any rate; there are no elective officers in a county, in a town where the race is about evenly divided.

To illustrate the kind of work we have done at Atlanta University, here are the four publications that we have there. The first thing was Mortality of Negroes in Cities. We began with the view perhaps of stating the conditions of the negroes in the cities as a sort of supplement to Mr. Washington's work considering the negroes especially in the country. Then this followed it. This was published first by the Labor Bureau officially and afterwards by us: Social and Physical Conditions of the Negro of several cities. We took different districts in the cities, that is, in each city—selected some typical districts. Then graduates of Atlanta University and other institutions went through these districts and took a census

and wrote their impressions of that particular part and published that. There is a good deal of statistics in them, except in the first one, but I think you may find something of this that may be of interest. This, *Efforts of American Negroes for Social Betterment*, includes all sorts of institutions, as the church work for charity, orphans' homes and asylums, and things of that sort which are gotten up and carried on by the negroes. The study last year was on *The Negro in Business*, and in the study this year we are trying to find out what all the men graduating in colleges, both North and South, are doing after leaving and how they are getting along.

Q. (By Mr. CLARKE.) Colored men?—A. Yes; colored men. Some of my students have made a study of various districts in Georgia which some of you might be interested in. This is in the *Labor Bulletin* for May, 1899, and then there will be in the *Labor Bulletin* within the next few months a study of the ownership of land by negroes of the whole State of Georgia, which I made for them last year.

I suppose most of you know the importance of a county town in a small Southern county. It is the capital of the county in the way that a New England town used to be perhaps two generations ago. Albany, for instance; everybody in the county of Dougherty must go to Albany at least once a month, and most people go once a week. It is an old-fashioned Southern town idea; the streets are lined with stores, and if you ever get a chance to go down that way you want to specially visit on Saturday when the whole negro population of the county comes out and takes possession of the town.

Q. (By Mr. LITCHMAN.) Where is that?—A. Albany; it is the capital of this county I am talking about; it is the county seat. The population I do not know whether I have here; the white population I am sure about; about 1,000 people live there, and of these 588—perhaps a little more than that—are colored. The distribution of the white and colored population in Southern towns is interesting. Sometimes it is like a circle, with the white population in the center, the colored population forming a fringe around the outside. In other cases, as for instance Atlanta, it is like a dumb-bell, with a settlement here and a settlement there, and connected by a short streak along through the middle. In Albany the town is divided almost exactly in two; the colored line runs visibly right through the town. There are some exceptions, but south of Broad the negroes live and north the white people live. The negro quarters of the town are well kept and there are some rather pretty houses. There are no distinct slums, but there are some old and dilapidated houses of bad repute—I suppose about 2 colored and 2 white—which are placed in the negro quarters of the town. You will notice here a thing I spoke about before. That is, there are 367 females and 221 males. There is an excess of women in town—negro women, of course. The reason for it is the negro women can get work. There is a great demand for them as servants and there is no such great demand for the men, though they get some work as porters, etc., but the women get much more steady work than men, and there is almost always an excess in Southern towns—in towns and in the country, too. I forgot to speak about the color here. In the country 68 per cent of the negroes were black, and evidently, so far as you could see, full blooded. There were 33 per cent who were brown. I do not know—it was impossible to tell—whether that was from mixed blood or from the color of the Africans, because some Africans are brown. I know we had one at Wilberforce who was quite light—almost yellow—who was a native-born African. Thirty-three per cent were brown, 4 per cent yellow, so you see the great mass of the people are dark there. In the towns there was a smaller per cent of the blacks, and that had come probably rather by the migration of the yellow and brown people from the country than from any very great lewdness in town. There did not seem to be very much of the systematic cohabitation between white and colored that used to take place. There may have been some of it, but I could find very little trace of it. Sixty per cent were black in the town, 32 per cent brown, and 10 per cent yellow. The negroes of Albany were mostly, of course, not born in the town. They were born somewhere in Georgia or out in the country. You see here in miniature the whole migration movement—the migration of the negroes from the country to the towns—and it is an extremely difficult thing to handle or to advise about even. I have spoken of the dull character of the country, the fact that life is very dull there. School is bad; just as soon as you get any sort of ambition or light breaking in upon a boy or girl they want to go to town, no matter how much we may say as to the desirability of their staying in the country. In particular cases it is very hard to tell them not to go—if they are staying in Dougherty County—if they want to get up in the world. There is very little chance for them if they stay out in the country—very little chance of their becoming land owners. Those who stay there and succeed have usually

had some extra talents. A good many of them have had some extra lift in some way—that is, perhaps their former masters gave them a chance to buy some land, or perhaps some man they were working for was especially careful to give them a chance to buy land, or if they went to town perhaps they made some money in some other sort of work, getting a start and getting ahead, and then they came back and bought their land. Sometimes they sent their children to town and the children went to work in the towns as servants, etc., and helped to buy land. In States farther North, in Virginia, land is bought by servant girls working in Philadelphia who send their money back, so that whole families will start to go to town, and when they come in town they reproduce the 1-room cabin that they have in the country—if they have been living in a 1-room cabin—and they have the same sized 1-room cabin, and the result is they get crowded into little tenement houses, close together, very often, and with high rents. As to the work which they find to do, that, of course, is much more varied in the towns than it is in the country. If they can once get a start they can usually buy land and own little homesteads around. I have here a record of those that own land in Albany. A larger number proportionally own land in the town than in the country, and they own, of course, much more elaborate houses usually. There are some colored men who live in town and own plantations in the country. Some of them are wealthy men. There is, for instance, a man named Powell who probably is worth about \$30,000. He has, I think, some 2,000 acres of land. He owns houses in town and then he owns a plantation in Dougherty County; and then he owns 1 or 2 other plantations in other counties. On some of his plantations he has white tenants living. Then there is a man by the name of Billingslea, who usually owns anywhere from one to two thousand acres of land which he cultivates. He must be worth at least \$20,000, I suppose. When I was down there the last time he said that the low price of cotton put him in a little worse condition than he usually was. He not only owns a good deal of land, but he hires land besides that, and then lets it out to tenants and renters. He runs a store, a blacksmith shop, and things of that sort. He is usually in town a good deal, but does not live in town really. There are, while I am speaking of that, there are several men there worth from three to fifteen thousand—I suppose perhaps 7 or 8 in the county that are worth from three thousand up. Of the men between 20 and 40 years of age, the largest number in any single occupation is that of day laborers. They work around. They do anything they can pick up to do. They usually get between 35 and 50 cents a day; I think about 50 cents a day usually, and do pretty well. If they get work fairly regularly they do better than they would do in the country. Then, after the day laborers, come the porters. They are employed in stores, and there are a large number of stores there, so that they do pretty well; some of them do very well. I visited a house of one man who was a porter in a drug store. He had a nice house of 6 or 8 rooms. I had an evening out there, and the people from the town met there and they had a very pleasant little gathering of people who were quiet and pleasant, and I enjoyed myself a good deal. They said he was practically a clerk in the drug store, although he was not called a clerk, but did almost a clerk's work, and did some writing and things of that sort; but he received a porter's wages, of course. I have forgotten exactly what his wages were now, but I think they were about \$20 a month—something like that—possibly a little more than that. There were 77 day laborers, 35 porters, 22 laborers in the mills. They have fertilizer mills there for making fertilizers, and laborers work there—colored laborers almost exclusively. They have a great many laborers who work around other sorts of mills. They have a few other mills, but I forget just what they are, but laborers work about as porters, etc. Then in all the cotton gins they work, although most of them are in the country. There are some of them around town there. After the 22 laborers in the mills come 19 laborers on railroads. The railroad laborers get pretty good wages and seem to be a fairly steady class of laborers. The trades are pretty well represented in the town. There are 11 brick masons, 7 barbers, 7 painters, 1 baker, 1 tailor, 4 firemen, 1 wheelwright, 1 plumber, 1 is put down as a mechanic, and 11 carpenters. All of the carpenter work is done by colored men. I lived in one or two houses which they built. One of them was a house where the teachers of this colored school, the A. M. A. school, lived. It was a very good house indeed, very well built, and unusually good for the town. These artisans get plenty to do. As I say, they have a monopoly of the market there; there are no white persons to compete with them. Then, besides those I have named, there are some professional men. There is one doctor who just came down there who is a brother of a girl I used to know in school, and he has built

and wrote their impressions of that particular part and published that. There is a good deal of statistics in them, except in the first one, but I think you may find something of this that may be of interest. This, *Efforts of American Negroes for Social Betterment*, includes all sorts of institutions, as the church work for charity, orphans' homes and asylums, and things of that sort which are gotten up and carried on by the negroes. The study last year was on *The Negro in Business*, and in the study this year we are trying to find out what all the men graduating in colleges, both North and South, are doing after leaving and how they are getting along.

Q. (By Mr. CLARKE.) Colored men?—A. Yes; colored men. Some of my students have made a study of various districts in Georgia which some of you might be interested in. This is in the *Labor Bulletin* for May, 1899, and then there will be in the *Labor Bulletin* within the next few months a study of the ownership of land by negroes of the whole State of Georgia, which I made for them last year.

I suppose most of you know the importance of a county town in a small Southern county. It is the capital of the county in the way that a New England town used to be perhaps two generations ago. Albany, for instance; everybody in the county of Dougherty must go to Albany at least once a month, and most people go once a week. It is an old-fashioned Southern town idea; the streets are lined with stores, and if you ever get a chance to go down that way you want to specially visit on Saturday when the whole negro population of the county comes out and takes possession of the town.

Q. (By Mr. LITCHMAN.) Where is that?—A. Albany; it is the capital of this county I am talking about; it is the county seat. The population I do not know whether I have here; the white population I am sure about; about 1,000 people live there, and of these 588—perhaps a little more than that—are colored. The distribution of the white and colored population in Southern towns is interesting. Sometimes it is like a circle, with the white population in the center, the colored population forming a fringe around the outside. In other cases, as for instance Atlanta, it is like a dumb-bell, with a settlement here and a settlement there, and connected by a short streak along through the middle. In Albany the town is divided almost exactly in two; the colored line runs visibly right through the town. There are some exceptions, but south of Broad the negroes live and north the white people live. The negro quarters of the town are well kept and there are some rather pretty houses. There are no distinct slums, but there are some old and dilapidated houses of bad repute—I suppose about 2 colored and 2 white—which are placed in the negro quarters of the town. You will notice here a thing I spoke about before. That is, there are 367 females and 221 males. There is an excess of women in town—negro women, of course. The reason for it is the negro women can get work. There is a great demand for them as servants and there is no such great demand for the men, though they get some work as porters, etc., but the women get much more steady work than men, and there is almost always an excess in Southern towns—in towns and in the country, too. I forgot to speak about the color here. In the country 68 per cent of the negroes were black, and evidently, so far as you could see, full blooded. There were 33 per cent who were brown. I do not know—it was impossible to tell—whether that was from mixed blood or from the color of the Africans, because some Africans are brown. I know we had one at Wilberforce who was quite light—almost yellow—who was a native-born African. Thirty-three per cent were brown, 4 per cent yellow, so you see the great mass of the people are dark there. In the towns there was a smaller per cent of the blacks, and that had come probably rather by the migration of the yellow and brown people from the country than from any very great lewdness in town. There did not seem to be very much of the systematic cohabitation between white and colored that used to take place. There may have been some of it, but I could find very little trace of it. Sixty per cent were black in the town, 32 per cent brown, and 10 per cent yellow. The negroes of Albany were mostly, of course, not born in the town. They were born somewhere in Georgia or out in the country. You see here in miniature the whole migration movement—the migration of the negroes from the country to the towns—and it is an extremely difficult thing to handle or to advise about even. I have spoken of the dull character of the country, the fact that life is very dull there. School is bad; just as soon as you get any sort of ambition or light breaking in upon a boy or girl they want to go to town, no matter how much we may say as to the desirability of their staying in the country. In particular cases it is very hard to tell them not to go—if they are staying in Dougherty County—if they want to get up in the world. There is very little chance for them if they stay out in the country—very little chance of their becoming land owners. Those who stay there and succeed have usually

Q. Well, now, do you think this change is an improvement?—A. Well, like all changes, it has dangers. It is in some respects an improvement. It is simply the echoing of the age. The people are feeling now that it is time for money-making and things of that sort, and they are getting interested in business and they are turning from the church, as they are bound to do some in the next 25 years, and they are going to turn more and more. Now, that turning, of course, is undoubtedly becoming a strain upon all sorts of moral relations, etc., everything that the church has taught. The only thing that makes it of less importance is that the church among the colored people has never been representative of the best morals, so that perhaps you may get out of the whole thing a purified church.

Q. (By Mr. LITCHMAN.) Does that not need just a little explanation, that the church has not been the representative of the highest morals?—A. I mean the church, being the representative of the whole social life of the colored people, has simply reflected the moral tone of the colored people. If you went into a community where things were conspicuously lewd, you would probably find a lewd minister of the church there, and a deacon who was not in any too good marriage relations, etc. Still one might find another church in another part of the town, perhaps, and you would find a collection of people in another church where the whole moral tone was quite different; but the social center, that is what the church is for, to be the social center. Now, when it loses its function of being the social center perhaps it will survive by being the moral center.

Q. Thereby take a higher position?—A. Yes.

Q. (By Mr. PHILLIPS.) Well, is it not a fact that religious sentiment is spreading more rapidly amongst the colored people than formerly?—A. No; I would not say that. It has not been my experience.

Q. Has not the education of ministers in recent years had very considerable to do with it?—A. Yes; but the influence of the education of ministers has been in another way altogether. It has been more in the upbuilding of stricter morals among the upper classes of the colored people, but it has not been technically in the spreading of religion. You take the old colored parson of the religion of 20 years ago, and he usually will shake his head about the religion of the colored classes to-day. For instance, in Atlanta, there is a church called the First Congregational Church. It is presided over by a man who graduated from Yale University. He is a splendid man in every way; well educated, and preaches sermons that are usually reported by the Constitution, some of them sometimes to quite a length, and the people who go there represent the very best colored people of the city. Undoubtedly they are people who own their own homes, and if you could not see them you would not think you were in a colored church, but nearly all of the older people have their doubts about how much religion there is in that church.

Q. It is a fashionable place?—A. Yes, but undoubtedly that church represents an advance.

Q. Some of the white churches are the same?—A. Of course; it has not gone so far with us yet.

I don't know that there is anything particular to notice in the town with regard to illiteracy, age, sex, etc. Of course there is less illiteracy in the town, and that comes from the fact that it has such good school facilities. The American Missionary Association planted a school there some 20 years ago. I think it was under white teachers for a while, and they have put it entirely under colored teachers, and it is very well conducted indeed. The teachers are all graduates, nearly all college graduates; some normal school graduates; and the attendance is large, 2 or 3 hundred, something like that. The public school is not quite so good as that, naturally. The teachers are not paid so well, and the school is not graded. They have a large number of students. The white school represents a thing that was often done in a good many places in the South. They have a special tax among the white people for the white schools, and give the proceeds of that special tax entirely to the white school, so it enables their school to run 8 or 9 months, while the colored school runs about 4, I think; something like that. The academy, however, of the American Missionary Association runs 8 months, I think, so the school facilities in town are far and away better than in the country. Of course the children have to pay to go to the academy, but not very much.

Q. (By Mr. CLARKE.) Is that special tax a town matter or a county or State matter?—A. Neither. It is a matter of private initiative altogether. There are a great many things done like that in the South. Now, for instance, sometimes there are towns where they allow everybody to vote. Everybody can cast his vote, no question about it, and yet it is tacitly understood that no colored vote shall be

counted for either candidate. That is, the result of the vote is determined by the white votes. The colored votes are not thrown out; they are there, but the result is determined simply by the white voters. Now, that is in accordance with no law, and it is not so all through Georgia, but in some communities it is so. Now, in the town of Albany, it is simply a private affair. The people are invited to contribute to the white schools. If there is a white family that does not contribute they will not shut the children out of school.

Q. Then it is not really taxation, but voluntary contributions?—A. Yes.

Q. (By Mr. FARQUHAR.) In this matter of discrimination in voting there—that is in local elections?—A. Local elections; yes.

Q. (By Mr. CONGER.) Are funds that are thus contributed by the white people handled by the regular tax gatherers?—A. I can not say about that; I don't know. It is very hard to find out anything of that sort, but I think they are; I think they are handled just the same as public funds are handled, and that the teachers are paid in just the same way, but I am not sure about that. At any rate, the teachers are paid from that. The public funds would only support the white school certainly not over 5 months, and it runs from 8 to 9.

Q. (By Mr. A. L. HARRIS.) Are the public funds equally divided between the white and colored schools?—A. No; possibly the negroes get a third in some States. Sometimes they do not get as much as that, but usually about one-third.

Q. What is the condition of the colored schools in the country, in Dougherty County?—A. It is pretty bad. In the first place, it runs less time; second place, very poor teachers, and practically no schoolhouses, so that the average colored child in Dougherty County can not get a decent education in the public school—that is, I mean an education that will allow him to read, write, and spell.

Q. (By Mr. PHILLIPS.) Take the South as a whole, is not education increasing and more colored people being educated each year?—A. Yes; but what is being done now is to educate the élite, the exceptional few. The common school in the South, in the parts of the South I have observed, the common school is very bad. It is my opinion, and merely an opinion, that the common school is worse off now than 10 or 15 years ago. There is not as good common-school education there; but as I say, I don't like to express very many opinions about the whole South, because things differ so much. That is where we get so many contradictions about the South. These are all provincial communities; they may differ vastly on little questions. You may find here and there a little community which has an excellent public colored school, but as I say my impression is, from what I have talked about and seen among the people, that a public colored school in the South is not as good to-day as it has been.

Q. (By Mr. FARQUHAR.) What is the popular opinion among the colored people of the South in respect to the education of the colored children?—A. Well, that question is a thing that is a little difficult to get at, but I believe myself that the colored people eventually have got to support their own schools.

Q. Do you find in the South any well-to-do Southern men that are really opposed to the Southern schools? Do you find any?—A. I do not know about that. In the first place, it is difficult for me to get at men in the South and talk to them. I have been in Atlanta for 4 years. Of course, I have not run around to find people, and yet naturally in a community like that you would think I would know some of the men of the community who were influential. I have not met a single one except Joel Chandler Harris, and I met him only about 50 minutes. So it is difficult for me to say; but from reading the papers there and from general developments my impression is that while there is a minority—a large and influential minority—that are in favor of the public schools and in favor of making them better, and representing the best class of the South, yet the majority of the people in the South do not like the negro public schools and do not propose to support them very long. That is my impression. It may be different in different States.

We had a bill in the legislature of Georgia to divide the taxes and give the colored schools simply the direct taxation actually paid by negroes, and not even give them any share of the indirect taxes. The bill was defeated, to be sure, but it was reported favorably by the senate committee and was defeated by a good many considerations which I do not think allowed the people to express their real opinion about taxation in Georgia for negro schools.

Q. (By Mr. LITCHMAN.) Now, as a matter of comparison, do you think there is an improvement in the last 10 years in the conditions and standing of the schools for white children?—A. I rather doubt that. I do not know, of course, nearly as much about that, but certainly in Georgia the schools for the white children are bad.

Q. How do they compare with the negro schools?—A. They are better than the negro schools.

Q. How do they compare with the New England schools?—A. There is no comparison at all, not even in a city like Atlanta. The white public schools are so crowded that the children can not get the attention they ought to have. The general run of the schools is not good at all. In Atlanta they have probably better schools than anywhere in the State, except possibly in Augusta and Savannah.

Q. Is the method prevalent there of private schools?—A. Yes; among the wealthy whites. There are a number of these girls' colleges for the daughters, and then the boys go to the denominational schools and the State university, and some of them to the North to school. I think there is still among the best people a dislike to the public-school system to some extent. I do not mean they actually do not think the poor whites ought to be educated, but they have their doubts as to whether that is the best method of giving a child an education—putting him in the public schools.

Q. Does that come in as a religious question?—A. To some extent, but not altogether. I do not know how much it enters into the public schools, but it does more than in Massachusetts, for instance, because the line between Methodists and Baptists in Georgia is drawn pretty tight.

Q. Are there any parochial schools?—A. I do not think so. Oh, yes, there are in Savannah; but I do not think there are in Atlanta. They have a very excellent State school commissioner in Georgia. If it were not for him the schools would be much worse off than they are.

Q. (By Mr. A. L. HARRIS.) How are the schools controlled locally?—A. The State appoints a county school commissioner. I think he is appointed by the State school commissioner. At any rate, he represents the State. Then there is the county board of trustees, who take care of the schools. I am not sure but there are also some local trustees. At any rate, the power is in the hands of the local elective board—in some counties elected by the people directly and in some counties appointed in a roundabout way. Sometimes there are colored representatives on the board, and sometimes there are not. Their action, of course, is apt to be tinged by all sorts of local considerations.

Q. (By Mr. PHILLIPS.) Have you any law to suggest along the line of education in the South for the benefit of colored people? Can the city or the State do more than it is doing?—A. I do not know whether the State can or not. In the first place, the people of Georgia complain a great deal of taxation. I can not understand why, but it seems to be a general complaint. I think, myself, it must be because the taxation does not fall upon the right persons. I think it falls hard on the landowner and the country person. They have no real good system of assessment. They do not have tax assessors but tax receivers, and a man gives his sworn account of the property he owns. In the cities they have tax assessors. He comes in and gives his sworn statement, and while that may be revised, as a matter of fact it is not in the case of an influential man. So that taxation falls heavily upon the small landowner and the small property owner, and the ordinary laboring people are taxed heavily for sewing machines and household furniture and things of that sort.

With a State that is complaining of taxation such as that, it is rather hard to suggest that they do more for public schools. More ought to be done for the white, and certainly more for the colored schools. It seems to me that the National Government has got to do something for common-school education in the South, and especially for the negroes. I think it is unfair that the South should have to bear the burden—the whole burden—of the education of the Southern negroes. It is an immense burden; there is no doubt about that. In spite of the many objections to the National Government coming in in a case of that sort, I think that it ought to, and as things are going now I do not see how it is going to keep out.

Q. (By Mr. CLARKE.) Is there any tax on incomes above \$1,000 or \$2,000 in Georgia?—A. I think not. I have never had it called to my attention, at any rate.

Q. (By Mr. PHILLIPS.) Would you recommend a law to be enacted by Congress for the general benefit of education in the South?—A. Some modified Blair bill.

Q. In proportion to the number of colored people in the States?—A. I do not know. I had not thought out any details at all. I should say rather in proportion to the illiteracy in the States, and, perhaps it ought to be in some way fixed

so that local endeavor would be supplemented by the Government's aid. Suppose, for instance, a State like Georgia should pass a law saying the taxation from negroes should go to negro schools, and from whites to white schools. That would mean between one and two months' school for the negro. Now, suppose the Government in some way should step in and say that if the negroes would, by their own initiative, add another month or two, the Government would do so much more. That would be an incentive for the colored people to do all they could. They could do a good deal, for in religion and churches they have done a wonderful work, in building churches, etc.; and now that they have churches they could build schools, and if they had that incentive it would lift a burden from the whites of the South and give the negroes a public-school system. I think it ought to be worked through the regular State officials. I think they ought to be kept in touch with it. I mean it should not lead to any greater division than there is now, but in some way to fix it so that the ordinary black boy in the South could learn to read and write and cipher. I think the nation owes that to them, and they can not do it in most parts of the South now.

Q. (By Mr. CLARKE.) How can the General Government draw lines of race or color?—A. It does. It would, of course, be a difficult thing. For instance, put the law in this way, that if there were any children in Georgia that did not get 2 months' schooling, if the patrons of that school would make the school so much longer, the United States would step in and bring it up to a certain term. Say nothing about color in it. In some cases it might go to help the whites.

Q. Would it not be well to make a law of that kind equally applicable to all?—A. Yes. If it made it in proper proportion to illiteracy it would not affect most Northern States. I think it ought to be made in proportion to illiteracy.

I wish the commission could have done some of this local study. I think there is a great deal that would have been learned from a number of local studies of this kind that would have thrown a great deal of light upon the question. Of course what I have said to-day only relates to a small county of one State.

Q. (By Mr. PHILLIPS.) Have you many colored labor organizations in the cities in the South?—A. There are some. They are a very curious development. I presume you heard at the time President McKinley was there they wanted the labor organizations to parade in Atlanta, but they would not allow the negroes to parade, and so the whites would not parade. That same thing has happened in Savannah, I think—in one other city, at any rate. Troubles arise continually on account of it. For instance, recently they organized the Electrical Workers down in Florida and sent them a charter. They found out afterwards that they were negroes, and tried to get the charter back, but the negroes would not give it up, and I do not know whether the thing has been settled yet.

Q. (By Mr. LITCHMAN.) Have you much information about the extent of labor organizations among the colored people?—A. Not very much. I simply know that in most building trades the negroes can join, and considerable numbers have joined. They sometimes meet in the same hall, the white on one side and the colored on the other.

Q. (By Mr. PHILLIPS.) Have you anything to volunteer?—A. I think not.
(Testimony closed.)

WASHINGTON, D. C., March 8, 1901.

TESTIMONY OF DR. CHARLES W. DABNEY, JR.,

President and Professor of Economics, University of Tennessee.

The commission met at 10.50 a. m., Mr. Phillips presiding. At that time Dr. Charles W. Dabney, jr., was introduced as a witness and, being first duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may please state your name, your address, and your profession or occupation.—A. Charles W. Dabney, jr., president of the University of Tennessee, and professor of economics.

Q. How long have you held your present position?—A. With the exception of 4 years' leave of absence, since 1887. I was here in Washington 4 years as Assistant Secretary of Agriculture with J. Sterling Morton, during the last Cleveland Administration.

Q. You have been interested in agriculture for several years?—A. All my life. I was reared on a farm. I was director of the agricultural experiment station in North Carolina for 7 years; then in Tennessee, and after a short time became president of the University of Tennessee, where I have been since 1887.

Q. You have received a plan of inquiry of the subcommission on agriculture?—A. Yes.

Q. Have you prepared a paper along the line of that plan of inquiry?—A. Yes.

Q. If agreeable to you, you may present that paper, and questions will be asked by the commission as you go along, or reserved until the close, as you prefer.—A. I would like to fulfill the pleasure of the commission entirely.

Q. Please proceed in your own way.—A. [Reading:]

"I have been asked to testify concerning 'the general agricultural condition of the South with reference to the changes and the diversification of agricultural industry, the condition of the negroes,' and any other topic with which I am 'particularly familiar.' I thank the commission very heartily for the opportunity to appear before them and will endeavor in the time allotted to discuss a few of the subjects which fall within this broad description. Taking further suggestion from our programme of subjects, I will, under the last clause of your invitation, ask permission to submit some remarks upon the education of country people in the South, and upon technical education, the basis of all progress in industrial matters.

"All great new periods in human history, as in natural history, begin with tremendous changes. This is as true in industrial history as in geological history. That great political and social cataclysm which we call the civil war was thus the beginning of a tremendous revolution which has gradually settled down into a quiet, but far-reaching, industrial evolution. Changing, as it did, the entire labor system and almost the entire social system of the South, this revolution affected the agricultural industry more than any other. For this reason, the economic and industrial conditions prevailing in the Southern States at the present time must be studied primarily from the historical standpoint. The violent change, between 1861 and 1865, was followed in 1870-1880 by a revolution in almost all industrial methods, but the changes are still going on and will continue to go on for a considerable time to come. The New South of to-day is the product and the heir of the Old South of 1860. Therefore, to understand the conditions to-day we must understand those before 1860 as well as those since 1865.

"We have had many political and some few social studies of this period of the history of the Southern States, but no connected studies of the agricultural development of the South have been made from this the only true standpoint. To understand the agricultural and general industrial conditions in the South to-day, we must first trace the course of this great revolution. A review of Southern agriculture during the last half century is the best preparation for a study of the agricultural resources and possibilities of the South at the present time. It is proposed, therefore, in this paper to take a hasty view of the chief facts with regard to the farming industry in the Southern States since 1860. It will only be possible, in the space allotted, to note the most important changes that have taken place and give a general account of the conditions prevailing at stated intervals. No exact statistical statements will be attempted, but the effort will be to give a true view of the development of Southern agriculture and a starting point for future investigations of Southern agricultural conditions.

"The condition of the Southern planter before the civil war was an ideal one in many respects. All the lower country and the better land was held in large tracts, cultivated by slave labor, under the direction of their owners or overseers appointed by them, the estates being usually divided into several farms, each under a separate manager. A single proprietor would often own a number of estates in the same section, and those who were prosperous were constantly adding new tracts to their holdings. The more respectable class of planters, regarding it as wrong to sell their slaves except by way of punishment, and never selling them if they could avoid it, found it necessary every few years to purchase new lands in order to supply work and sustenance for their rapidly growing negro families."

This was especially true of the Atlantic States and all over the South, except in the great sugar and cotton plantations, where the slaves were managed, to too great an extent for their own welfare, by hired overseers.

I recollect as a child the anxiety of my grandmother in Louisa County, Va., whose slaves had multiplied so rapidly that she had to go down to Pittsylvania and Henry counties, to the south of Lynchburg in the Piedmont country, for the sole purpose of providing land to be cultivated by her multiplying slaves. They were a real burden to her, and having this principle that she would not sell any except by way of punishment, I think it was a great relief to her to get rid of them. Perhaps a little incident would be in place. I remember as a child at the close of the war, sitting at the table in the old homestead, where she was entertaining a number of Federal officers—young officers of the Army camped all over the country at that time. A regiment or division made their headquarters at her place, and very pleasant relations were established between her and them. She was at that time about 65 years of age. They were talking very pleasantly, and they seemed to be struck with her courtesy and to feel very much at home. They got to talking very familiarly about these matters and even joked the old lady one morning at breakfast, and an officer said, "Mrs. Dabney, I do not see why you are so nice to us. We have torn your country all to pieces and robbed you of your slaves. I do not see why you treat us so cleverly. I should think you would hate us, but you are certainly very kind to us." Her reply was, "You have not set my slaves free; you have set me free." I remember those words. That was the feeling of a great many people in the South. They were really tremendously relieved to have this burden lifted off their shoulders. The owners who believed it to be their duty to care for and protect and guard their slaves were greatly relieved. But that is aside. [Reading:]

"After the best lands in the Eastern States had been fully occupied it was the custom of these planters, when their negroes had multiplied beyond the ability of the home estates to maintain them, to purchase new and rich lands in the rice, cotton, or sugar growing sections of the South and send out, under the leadership of a son or overseer, a portion of their slaves to open up and work them. By 1860 the best lands in the Southwest, as well as in the South Atlantic section, had all been settled in this way.

"From the industrial standpoint the old plantation organization was a very perfect one. Great executive ability was required to manage it, and the lordly owner of these vast estates was far from the idle, sport-loving, or politics-talking spendthrift that he is commonly supposed to have been. If he kept his property together and took care of all his dependents he was a busy, hard-worked man.

"Having almost perfect control of his labor, the Southern planter was able to utilize every worker to good advantage, and, as a rule therefore the slaves, as well as the masters, lived in a state of reasonable physical comfort and in as great happiness as is commonly vouchsafed to man. The South was prodigiously prosperous between 1850 and 1860, and every department of its agriculture was developing at a stupendous rate when the war came and overthrew this system.

"The model planter of those days produced at home everything that was needed to feed and clothe his slaves, and, to a great extent, also his own family. Except in a few sections of the South, where the lands were especially well adapted to rice, cotton, or sugar, and yielded such great profits that it paid the planter to devote all of his labor to their production alone, the wheat, corn, and meat to feed the people, and, to a large extent, the cotton, wool, and leather to clothe them, were produced and manufactured upon the plantations. Almost every large farm had its gristmill, and many their flouring mills. Nearly every large estate had its tannery and shoe factory, its blacksmith, wagon, and implement shops, and its spinning and weaving factories also. The older plantations in the upcountry were filled with these and other kinds of industries, nearly all of which have since disappeared. The old planter and his dependents lived thus, to a large extent, upon the products of his estate, which were manufactured in a somewhat crude way, perhaps, upon the estate. Only the iron and steel, the finer groceries, a few medicines, and some of the richer cloths for the use of the owner's family were purchased in the cities. Almost everything else was made upon the farm or purchased from the small factories belonging to the country.

"The antebellum planter thus made his money crop, whether wheat, cotton, or sugar, at a minimum cost; in fact, he usually sold enough surplus food products to enable him to count the money received for his staple crops as clear profit. This is a most important fact for our present discussion, since, in recent times, in the effort to produce a maximum crop of cotton or sugar, the Southern farmer has seemed to forget that he could and should make all his food supplies at home, and change his industrial system entirely. If, in the last few years, he has learned again the important lesson of living at home, he is merely readopting the successful practices of his ancestors of antebellum days. The following simple

comparison between the production of corn and hogs for the census years 1860 and 1890 illustrates and proves this:

	Corn, in millions of bushels.	Hogs.
North Carolina:		
1860	30	1,900,000
1890	25	1,250,000
South Carolina:		
1860	15	965,000
1890	13	495,000
Georgia:		
1860	30	2,000,000
1890	29	1,400,000
Alabama:		
1860	33	1,750,000
1890	30	1,421,000

"We see hence that with less than two-thirds of the population the typical Southern States, North Carolina, South Carolina, Georgia, and Alabama, had more corn and hogs in 1860 than they had in 1890.

"It can be shown from the census in the same way that these States also produced more wool for winter clothing in 1860 than they did in 1890. Before the war this wool was almost wholly used in domestic manufactures.

"The difference in the production of wheat in the State of North Carolina between 1860 and 1890 is not so marked, but in South Carolina, Georgia, and Alabama the comparison for wheat stands as follows:

	Bushels.
South Carolina:	
1860	1,300,000
1890	660,000
Georgia:	
1860	2,500,000
1890	1,000,000
Alabama:	
1860	1,200,000
1890	200,000

"(The year 1890 was a very bad crop year in Alabama.)

"These figures show beyond question, as recent results have demonstrated even more clearly, that the South can, under a proper system, produce all the food and other products of every kind that will ever be required by her own population, and that the practice of devoting their whole attention to one crop, which prevailed in many sections between 1870 and 1890, is, for the farmers of the South, wholly unnecessary, as well as most uneconomic.

"The abolition of slavery caused the destruction of this system and made it necessary for Southern planters to organize their industry upon a new plan. It was quite natural that many of them should strive for many years to carry on with hired labor a system similar to the antebellum one. Except in a few cases of planters who had exceptionally rich lands, far removed from the disturbing influences of the towns, the effort to farm according to the old methods proved very disastrous. Labor was of course completely disorganized. The planter was under no obligation to maintain the negro except when he wanted him, and he therefore wandered about from place to place as fancy impelled. The unfortunate slave, thrown wholly upon his own resources, was compelled to sell his unskilled labor in the towns, where the supply was usually far greater than the demand. As a result he suffered even more than his former master.

"Without recounting all the sad features of this terrible time, it is sufficient for our purposes to note that under the stimulating influence of high prices for cotton, sugar, and other money crops Southern planters were led to divide their great estates into small farms, which were rented out to tenants, usually for a part of the crop. The average Southern farmer of 1870 was found thus with a small farm under his own management and the remainder of his land let out to negro tenants, to whom he generally supplied the stock, implements, and food with which to make the crop. Both landowner and renter devoted their attention to making the maximum amount of the money crop, usually cotton or tobacco, and as good prices prevailed for a number of years they soon fell into the unfortunate practice of purchasing a large portion, if not all, of their supplies of bacon and flour, as well as of agricultural implements and fertilizers, from the commis-

sion merchant to whom they delivered their crop at the end of the year. When the prices of cotton and tobacco declined these people still kept on growing them year after year in the hope and belief that they would soon go up again, but with the result that they were soon in bondage to the commission merchant, who was always prompt to take mortgages upon the farmers' land and stock to secure his debt. The poor negro tenants, who spent in frolicking during the winter all the money they received for their crop the previous year, had also to mortgage their little stock of mules and implements and usually also their whole crop in advance in order to get money to carry them through the growing season. The result of this system was of course that many of the best farms in the South passed into the hands of commission merchants, who, having capital, were prompt to introduce better methods. Many of these merchants have become most successful farmers, and their example has done much to improve the country."

We have a very interesting condition in northern Alabama. The Jew, who has never been a farmer in this country, has actually become a farmer down in northern Alabama. He went there as a merchant and became a trader with the people. They mortgaged their land to him, and he soon acquired it. He found he could make money on it, and we have in the black belt of the South a great many Jew farmers—quite a remarkable thing. They live in the towns and operate the lands themselves, and make a good deal of money. So it is that a great many outsiders have come in, and doing a mercantile business first have acquired lands.

Q. (By Mr. KENNEDY.) You mean the Jews do the farm work themselves?—A. No; they are the owners.

Q. (By Mr. PHILLIPS.) Residing not on the farm, but in the town?—A. Yes; but operating the farm for themselves.

Q. (By Mr. LITCHMAN.) Are they working their farms with tenant farmers?—A. No; they are generally working the farms for themselves and using the very best methods.

Q. (By Mr. TOMPKINS.) With hired labor?—A. Yes. The tenant system has injured the State too much, and they will not allow their land to be abused. They are using the very best business methods and hired labor. They are helping to build good roads and schoolhouses and developing the country in a public spirited way. Since they have become landowners they have become remarkably good citizens.

(Reading):

"As is always the case in such revolutions, the careless and thoughtless went to the wall and the industrious and shrewd took their places to develop a new system. The chief feature of this new system is the reestablishment of diversified farming and the production of food and other supplies for the farm upon the farm. Those who had the bravery and common sense to bear a little privation for a year or two invariably came out of this revolution victorious. A case in the experience of the writer will illustrate the method by which the cotton planter had to work out his own salvation from the mortgage system, as it does also the genuine heroism of many of these people.

"A Confederate soldier who returned from the war in 1865 to live in a dilapidated house and to farm a portion of the paternal estate, collected a few worn-out Government mules and went bravely to work to make a support for a small family, which had been sadly neglected for several years. Like others of the class that has been described above he devoted his whole attention to cotton production. So long as prices kept up he was comfortable, as he had plenty of money with which to buy the meat and flour, the groceries and clothing, needed for the rapidly growing family. When cotton went down he believed, with all the rest, that the decline was only temporary, and therefore borrowed money and put in another crop. After several years he found that everything he had was mortgaged and that he was in debt to the amount of the value of 2 ordinary years' crops of cotton. After going on in this way for a number of years, during which he barely managed to keep his debt from growing, the brave old soldier, after consultation with his devoted wife, formed the resolution that for 2 or 3 years they would live on such things as could be produced at home and buy absolutely nothing, making only such cotton as he could without going into debt. A few good cows were collected, a garden was made, poultry was raised, and the family lived upon the supplies thus provided, or, when these ran short, upon such corn, sweet potatoes, and wild fruit as had been produced upon the farm. Several times the family were reduced to a diet of baked potatoes and milk. The wife and children went without new clothing for 3 years, and all hands devoted their attention to making such cotton as they could. The father, 2 sons and 3 horses cultivated over 100 acres of his best

land in cotton each year at a clear profit of from \$7 to \$18 per acre. Fortune smiled on the brave souls, and after struggling for 3 years an exceptionally good crop was produced, with the result that the mortgage was paid off and the good farmer and his noble wife and boys began life again upon the old farm which, in the sweat of their brows, they had earned back once more. It is needless to say that this sensible couple have since prospered in splendid fashion.

"Thousands of Southern farmers had to work out their salvation from mortgages and commission merchants in a similar manner, by toil and privation. Many who did not win their liberty before, but kept on mortgaging their crops in advance and going deeper and deeper into debt each year, had to submit to foreclosure and lost their entire property. The majority of these unfortunates moved to new sections and took up new land; the less enterprising became renters, very often upon the land which they formerly owned; the bravest and best element, however, was driven by the continued low prices to adopt the heroic method followed by our soldier, and paid off their mortgages by hard labor and sore trial.

"The recent period of low prices of cotton, tobacco, and almost every farm product has been a 'blessing in disguise' to the Southern farmer, for when the price obtained for cotton or tobacco came dangerously near the cost of production he was driven to stop making these crops entirely, and to grow corn and wheat and make all his supplies at home. Many a Southern farmer has found through severe experience that cotton and tobacco were not the only paying crops, and many of the more intelligent who turned their attention to truck crops or fruits have established a business which pays them far better than cotton did even in the day of high prices. So it has come about that during the last 7 years particularly a very remarkable change has taken place in the methods of Southern agriculture. All farm crops have been wonderfully diversified, resulting in the production at home of a large portion of the food of both man and beast.

"Corn has been the leading crop in this revolution, as the following striking figures will show: The production of corn in the Southern States, including Maryland and Texas, was, according to the statistician of the Department of Agriculture, in 1893, 435,745,766 bushels; in 1894, 433,421,962 bushels; in 1895, 607,695,017 bushels, and in 1899, 592,000,000 bushels. This increase in the production of corn has been chiefly in those States which formerly produced the most cotton and tobacco. The States of Georgia and Mississippi, for example, each produced 12,000,000 bushels more corn in 1899 than they did in 1893; Alabama produced in 1899 17,000,000 bushels more corn than in 1893; the State of Texas alone produced 50,000,000 bushels more corn in 1899 than in 1893. This means a great deal more than appears from the bushels of grain produced, for the corn stover is the great forage crop of the South, as it is of the entire country. These increased crops of corn give rise to a prodigious increase of food for both man and beast. It takes the place of grain hitherto bought from the West, and produces a great deal of meat which formerly was bought there also.

"The figures showing the increase in the acreage of hay and other forage crops are equally striking. For example, for every acre mowed in 1879 in Alabama and Georgia there were 3 acres mowed in the same States in 1889; Arkansas in 1889 mowed 5 acres for every one mowed in 1879, Mississippi mowed over 7 acres for every one, South Carolina over 10, and Florida over 23 acres in 1889 for every acre mowed in 1879. From this we see that the South is not only producing its own grain, but also its own hay. According to the Department of Agriculture there were 3,638,000,000 tons of hay produced in the South in 1899. The same is true of all other forage crops, and this means, of course, more and better stock and more and better milk and butter.

"After learning this increase in the production of corn in the South we are not surprised that the reports made to the Department of Agriculture show that there were 3,000,000 more hogs in the cotton States in 1899 as compared with 1890.

"The reports of the railroads speak loudly to the same effect, and show beyond question that the reduction of the importations of breadstuffs and meats into the South is a very great one, and can only be accounted for on the theory here propounded, namely, a revolution in the system of farming and the establishment of a diversified agriculture which produces these supplies at home. As the eloquent and lamented Bishop Haygood expressed it in a recent article, 'Hog and hominy is now the battle cry of our people, and we intend to win on this line, no matter how low the price of cotton may be.' Country folk now tell with pride and a happy look of independence, 'I live at home and board at the same place.'

"The milch cow may well be called the housekeeper of the farm. From an industrial and economic standpoint she is the manufacturer of all forms of spare food products made upon the farm. For this reason her numbers and products speak more eloquently oftentimes, with regard to farm and family thrift, than

Almost anything else the census counts. Let us see, therefore, what her statistics each us with regard to the South: In 1880 the census tells us there were only 1,500,000 milch cows reported in the South; in 1890 this had increased to 2,800,000, and the reports of the Department of Agriculture indicate that the cows in the southern States now number over 3,000,000—still many less than we ought to have and could support. The introduction of the so-called 'no-fence' laws, which requires that all stock shall be kept at home or fenced in, has further led to the elimination of worthless cows and the better care of those remaining. The production of cheese has doubled also. This industry has recently been firmly established in the State of South Carolina, where it was previously almost unknown. The figures with regard to poultry are equally as favorable as are those for dairy products.

"It will be interesting to note next what influence these changes of the last 30 years have had upon the size of farms, the area of improved land, and the value of farm products. Taking North and South Carolina, Georgia, and Alabama as representative States for our present investigation, the following small table, showing the average size of farms, is interesting:

States.	1860.	1870.	1880.	1890.
North Carolina.....	316	212	142	127
South Carolina.....	188	233	143	115
Georgia.....	430	388	188	117
Alabama.....	317	222	139	129

"The steady decrease in the average size of farms since 1860 is in conformity with all other facts in our possession. The figures with regard to the number of farms of 500 acres and over since 1880 are as follows:

States.	Number of farms of 500 acres and over.	Decrease between 1860 and 1890.
North Carolina:		
1860.....	6,784	
1890.....	5,986	798
South Carolina:		
1860.....	5,328	
1890.....	4,410	918
Georgia:		
1860.....	10,508	
1890.....	8,819	1,689
Alabama:		
1860.....	6,553	
1890.....	5,630	923

"With the multiplication of farms the acreage of unimproved lands has decreased very rapidly also. Taking North Carolina as an illustration, we find that 72 per cent of the land in farms was unimproved in 1860, 73 per cent in 1870, 71 per cent in 1880, and 65 per cent in 1890. In Georgia 69 per cent of the land in farms was unimproved in 1860, 71 per cent in 1870, 68 per cent in 1880, and 62 per cent in 1890.

"The total value of farms, including buildings and fences, increased very rapidly between 1880 and 1890, as shown by these interesting figures:

States.	Total value of farms.	States.	Total value of farms.
North Carolina:		Georgia:	
1880.....	\$135,793,602	1880.....	\$111,910,540
1890.....	183,977,610	1890.....	152,006,230
South Carolina:		Alabama:	
1880.....	68,677,482	1880.....	78,954,648
1890.....	99,104,600	1890.....	111,051,390

"Since these values are based exclusively on the statements of farmers themselves, who are known to be very conservative, and even shy, in making returns of their property for fear of increased taxation, we may safely assume that the figures here given are far below the commercial value of their property at the time.

"With the reduction in the size of farms and the diversification of crops an opportunity was created for intensive methods of agriculture, as compared with the previous extensive methods, which tended to wear out the soils of the South, as they will do any country. The use of fertilizers in the Southern States has increased enormously with the movement for intensive culture. In 1890 the total consumption was 20,500,000 tons, as compared with 2,300,000 tons in 1880, an increase of about ninefold. What is better still, the farmers of the South have learned how to use farm manures, or, these failing, to prepare manures at home from cotton seed or the cheap phosphates mined in South Carolina and Florida and manufactured in nearly all of their leading towns. There is every evidence, in short, that the production per acre is increasing rapidly for all Southern crops. Intensive farming has come to stay.

"In conclusion, we may affirm that the painful revolution in farming methods in the South is now a thing of the past, and that her farmers are settling down under the new conditions, and may expect better times at an early day. The reconstruction of the industrial and commercial life of the South, which is always more tedious and trying than political reconstruction, is now practically accomplished. Such a reconstruction of industrial conditions is absolutely necessary in all countries from time to time, and was bound to follow the great change which took place in the South as a result of the civil war. Such a reorganization is always, however, the sure precursor of new growth and great progress. Through the breaking up of the large plantations, the introduction of new crops, the general diversification of farming, and especially through the introduction of a new economic system, in which the chief feature is the production of supplies at home, Southern farming has now been established upon a new and safe basis.

"Now, I believe we may say that the period of storm and stress is past, the revolution is over, and the South has entered upon a period of natural evolution which will carry its industries steadily forward for many years to come. Business has settled fairly well in the new channels and things are moving on smoothly again. The people of the South are already enjoying a period of great prosperity. Cotton, cattle, and mules are bringing better prices than they have for many years, and the cereals and tobacco are bringing in good returns also. The student of history will declare that this had to come in due course of time, and that our present prosperity is the result of the natural course of events in the evolution of industry rather than of any particular financial or political measures. No tariff bill or coinage measure accounts for the present prosperity of the people of the Southern States. Such measures may slightly retard or hasten these great movements, but this prosperity was bound to come to the South as soon as her people got their labor and other industrial agents thoroughly well organized and learned to adapt themselves to the new economic and social conditions."

Q. (By Mr. FARQUHAR.) You spoke of the farmers being relieved of the bondage of the commission merchant.—A. That is a little rhetorical. It was the result of the conditions and unavoidable.

Q. These commission merchants were handlers of foreign capital, were they not?—A. A large proportion; not all. A good many of them handled the business properly, and it was a legitimate business, and a business which someone had to do, although it was unfortunate for the farmer; yet no one blames the commission merchant. They got a good deal of capital from the outside, especially when the time came to move the crop; but I think I can say a large part of the capital used for carrying on the farms was their own capital. They would always draw on the Eastern banks when the time came to move the cotton.

Q. Was the capital local or outside that was used in what was called the crop lien?—A. I think that was very largely local capital. The profits on that business were large, and after a few years of that method of doing business, those gentlemen had the capital of their own.

Q. Does that prevail to quite an extent at the present time, or is it gradually dying out?—A. It is gradually dying out, but it still prevails. The farmers do not buy their supplies, bacon, flour, and corn, to such an extent in the cotton country like Alabama and Mississippi as they did before. They live far more at home; and in the eastern Atlantic States it is dying out very rapidly. They are becoming more and more self-supporting, and less and less dependent for supplies on the commission merchant. I think the progress there on the whole has been more than in the extreme southern cotton States.

Q. (By Mr. PHILLIPS.) Was a difference made in the payment of cash in buying supplies?—A. Supplies were usually advanced at a very high profit.

Q. Much higher than if the cash was paid?—A. Yes, much higher.

Q. (By Mr. FARQUHAR.) What effect has this crop lien on the condition of the black man, whether a tenant farmer or worker?—A. In Alabama and Mississippi

he was more completely a slave than ever before. I have a paper in preparation wherein I characterize it as a new slavery. He is getting out of it under the instruction of Booker Washington, and such other people.

Q. (By Mr. CLARKE.) I would like to inquire if this revolution which has taken place grew out of any public agitation by agricultural societies, granges, or anything of that sort, or was it the experience of the individual farmers?—A. It began with us about 1891 and 1892. There was a little agitation of this subject by the more intelligent farmers in conventions and societies, but more recently in these conventions of farmers and our meetings held in trying to limit the production of cotton. At these conventions the talk was diversified crops, growing food supplies at home, taking the acreage out from under cotton and putting it in other crops. By limiting the acreage of cotton they hoped to increase the price. There was a great deal of intelligent discussion among the people, but it was chiefly the result of necessity. The natural conditions were all there. The South is naturally the home of diversified agriculture, and they were not limited to cotton and tobacco. So they soon yielded to their necessities. The natural economic law had a big part in it.

Q. You spoke of the decline of sheep husbandry. Is it due to the depredations of dogs? That is true largely in some of the Northern States, and I would like to inquire if you have any new dog laws in the South to protect sheep?—A. Very few that are adequate. We are agitating it now in some of the States. In my State, for example, it is a burning question before our legislature this winter, and I think we are going to get a new dog law. A few years ago we had the same agitation, but the people were not ready for it—public sentiment not educated sufficiently to support it. The legislature passed a stringent dog law and a good deal of killing was done all over the State, but not a single man of that legislature was elected to go back again. That was some 12 or 13 years ago, and we have got around to it again, and I think we will give the people a good reasonable dog law. Ours will be a great sheep State, but we now have fewer sheep than we had in 1860. I have a friend in Virginia who has carried on more or less of a sheep industry during all this period. He had a large amount of land and employed good men. He killed all dogs no matter whom they belonged to—killed them all. But very few people have the energy and public spirit. The small farmer could not do that. That was the trouble, and that is what we will have to remedy.

Q. I would like to ask if there is any change of habit among the people of the South in regard to consuming mutton?—A. Where we have sheep the spring lambs bring a good price. Quite a good deal of the sheep business of the South is devoted to raising spring lambs for the Eastern market. Up in southwestern Virginia there is a considerable industry devoted to raising spring lambs. The Southern people are using the mutton in the cities. It is always on the market and is liked very much, but they prefer beef and pork. I think they will use more mutton as soon as there is mutton to spare, but at present they sell their lambs and make wool, and do not reserve much mutton to consume at home. They ship the best of all kinds of products, as is usual everywhere with country people.

Q. (By Mr. FARQUHAR.) Your industrial conventions in the the South have passed resolutions for a number of years back with respect to the restriction of the area put in cotton. What effect has the rise of prices in the local markets had on those resolutions?—A. They dropped all that sort of business. That was laughable. They never succeeded in reducing the acreage by resolution. Many of their own members would say, The other fellows are going to reduce their acreage; I will leave mine as it is or increase it. So that never amounted to anything. But the acreage of cotton does not seem to increase as rapidly as the larger price would suggest. People in the South are making cotton cheaper than they have ever made it in their lives before, owing to this experience that they have been through. In 1880 they could not make cotton anything like as cheap as they do now. We have better implements, and we know better how to cultivate it and handle it and market it.

Q. (By Mr. PHILLIPS.) Can it be cultivated now on a large plantation by hiring help?—A. Yes; on good land it can be cultivated with great profit. On the best cotton lands of the South we use machinery for plowing and cultivating cotton. We use it in every process except picking. All the rest is done by machinery.

Q. Has not the theory been in the South that one man with a mule could raise it cheaper in a small lot than a man could cultivate a large plantation? Has not that been the rule?—A. Yes; that was at one time, but they have applied machinery to the culture of cotton to such an extent that I think it has proved that to be a shortsighted view. I do not know of any crop, not even wheat in the Northwest, that can be cultivated on such a wholesale plan as cotton is in the Brazos

bottom. It is cultivated on a very large scale. I have seen in that bottom 40 cotton houses in one cotton field of miles in extent—perfectly enormous—like the big wheat industry in the Northwest—all done by machinery and at tremendous profit with these prices.

Q. (By Mr. A. L. HARRIS.) Do you get a profit from the seed as well as the lint?—A. Yes; we estimate the seed is worth about one-third as much as the fiber.

Q. Is the value of the seed increasing?—A. It seems to be increasing from year to year.

Q. Is your soil increasing in fertility under diversification?—A. I think so, in general. There is so much of it that has been impoverished that you can not see yet that the cotton farms have improved, but the conditions have improved. Some are improving where the diversified methods have been thoroughly used and going on for 4 or 5 years.

Q. Will it not be still more likely to improve under the new system of the landlord looking after his own land?—A. Yes, indeed; and the making of home manures, dairying especially, and stock feeding is sure to improve his soil very much. You see cotton takes nothing off the soil if you keep the seed there, and if you make forage crops and feed the animals and make the home manure you are bound to improve, and that is what they are doing.

Q. Is there any profit in raising fruit in the South?—A. Many portions of the South; it is a very fine fruit country. Every man thinks his own neighborhood is a fine fruit country. I think it is a good fruit country all through. Peaches are grown at great profit in many sections of the South, Georgia especially. We are learning how to spray them to keep off the insects. People formerly would stick a tree in the ground and not cultivate it but just let it grow. They found it pays to cultivate and spray them, and there is going to be a great development in the industry. Many sections in the South are adapted to peaches.

Q. Is there a disposition to get rid of the old crop-lien system?—A. Yes; they are clearing up things rapidly. The more shiftless have become tenants, some have gone to Texas or Oklahoma, and the best of the people have worked out of their troubles and got possession of the land and are improving it. I have a very optimistic view of the agricultural outlook in the South, and think our troubles have largely passed.

Q. (By Mr. A. L. HARRIS.) You have a paper on education?—A. I next have a paper on the negro for agricultural labor.

Mr. PHILLIPS. The Doctor will proceed with that paper if there are no further questions.

The WITNESS. I did not follow the same methods in discussing this as I did in the short paper. That is, I treated this from an historical standpoint.

THE NEGRO AS AN AGRICULTURAL LABORER.

The question of the future utility of the labor of the negro is vital to the prospects of agriculture in the Southern States. The census of 1900 reports 7,000,000 negroes in the South. A very small proportion of these have become proprietors and employers of labor. A few have become the owners of small farms, which they work for themselves, but the greater majority must make their living as wage laborers of one kind or another.

So that we must consider the negro as an agricultural laborer—9 out of 10 of them are—and it is hardly worth while to talk about him as a factor in industry, although I believe he is going to do his part there. I think the failure of the negro in cotton factories and so on is due to the location of the individual factories and to management rather than anything the matter with the negro. In talking with his competitors recently about the failure of the cotton mill at Charleston, I think it was because it was not located at the right place, because the city negroes are not as good as the country negroes, and because you can not in the city live near enough to the cotton factory; they can not be controlled; the city negro does not make as good and reliable laborer as the country negro; so for our purpose the negro is an agricultural wage laborer.

It has been so commonly charged for many years that negro slave labor as organized between 1800 and 1865 was a bad system industrially.

Almost all our economists, President Hadley, of Yale, the most carefully observing great man we have among us, perhaps, writes it up that way, that the old negro slave-labor system was industrially a bad thing; so it has gone into all text books, and I have undertaken to investigate that somewhat according to the facts.

It is still commonly believed by those who have never studied Southern conditions and even by many employers in the South who have never had experience with the common laborers of the North or the foreigners, like the Italians and Hungarians,

that the negro is a comparatively worthless laborer. All uneducated, untrained laborers are worthless, of course, compared with educated, skilled laborers, but is it true that the country negro of the South is a worthless laborer as compared with a race of equal intelligence? If the negro is such a bad laborer, why is it that Northern contractors as well as Southern always prefer him to the Italian or even to the poorer Irish if they can get him to work for them?

One of those McDonalds, of east Tennessee, built a railroad up here through northern New York in the Adirondacks, and went down in Alabama and Mississippi and got all negro labor to build the railroad. Why do they do that if they are not good laborers? They are good laborers.

Is there no way of ascertaining the facts of his efficiency in a scientific manner? Can not we ascertain from sure facts what were the comparative economic results of slave labor in the South and white labor in the North, when they are well organized, although we may not approve of that system, we recognize from the standpoint of organization a good system. Can we get some sure facts by which we can compare the results of slave labor in the South and white labor in the North? For example, it may seem like threshing over very ancient straw to go back to the census of 1850 and 1860 for our facts, but since we can get no later facts for slave labor we are compelled to do so. I have sought information, therefore, from these sources with which to answer these questions.

The facts show that slave labor as organized in the Southern States was economically one of the most efficient and productive labor systems ever applied to agriculture.

The comparison is between the results of slave labor in the Southern States and those of free labor in the Northwestern States (from Ohio to Kansas and Minnesota). It is well known that the Northwestern States have by nature more fertile soils than the Southern States, but on the other hand the Southern States along the Atlantic coast had been longer settled.

In 1850 the total assessed values of the Southern States were \$2,900,604,589, to 9,348,924 total population. Subtracting 3,204,313 slaves, there are left 6,143,924 whites. If these total values had been divided among the whites per capita they would have given each man, woman, and child \$472. If the negroes are counted among the population they would have had \$310 each, white and black; or, omitting the property in slaves, assessing them at \$250 per head, men, women, and decrepit, which is a high estimate for 1850, we have left a total value of \$355 for each Southern white.

In 1850 the white-labor States had 13,500,000 souls and assessed values amounting to \$3,621,011,661. Each soul, then, had an average of only \$270. In other words, the Southern whites had \$85 more each after deducting all their property in Africans, in which hundreds of millions of dollars were invested. If the Africans had been counted for property, then the average Southerner would have been richer than the average Northwesterner by \$202.

In 1860 the South had about 12,000,000 people, including a little less than 4,000,000 Africans. The assessed values had increased to \$6,746,343,761, more than double what she had 10 years before. The period of 1850-60 had been one of prodigious prosperity for the South.

The white-labor States, with a population now numbering 18,800,000 souls, had in 1860 total values of \$9,257,964,000. The Northwestern States had received, through foreign immigration, annual accessions of several hundred thousand people, estimated to have brought with them besides their persons and labor an average of \$300 each in cash. Still, the relative major wealth was with the South, each white soul having \$831, against \$490 for each soul in the Northwest. If all property in the labor of Africans be again deducted, each Southerner still had \$637, as against \$490 per capita in the Northwest. We have made the deduction this time at the rate of \$400 for each soul of the Africans. Finally, if the division of the Southern total values be made between the whole population, including all the Africans, there was still an average of \$560 per head, against \$490 in the Northwest.

Next, let us compare some of the leading agricultural productions. In 1860 the free States raised, of the cereals used by Americans as human food—wheat, corn, etc.—561,000,000 bushels, and the Southern States 494,000,000; that is, the free system gave each of its souls about 30 bushels, while the slave system gave each one of its souls 41 bushels. The Northwestern States considered these cereals their great export crops. The Southern States, after feeding every one of their souls one-fourth more of cereals than the free States, had a proportional surplus for export, besides her great exports of cotton and tobacco.

Of the domestic animals used by Americans as human food (cattle, sheep, swine, etc.) the Northwestern States had in 1860 about 40,000,000, a little over 2

for each inhabitant, while the slave States had 40,500,000, or about $8\frac{1}{4}$ for each inhabitant. As the flesh of swine forms the chief food of the laboring man, it will be interesting to see the proportions of it which were supplied. The Northwestern States had not quite 12,000,000 of swine in 1860, while the slave States had 20,600,000, confirming what I said before, that the South is naturally a meat-producing country. The conditions are right for them by proper attention to-day to grow South as successfully as in any part of the West or Northwest.

The Northwestern States gave each mouth a little more than 0.6 of a swine per annum, while the slave system gave each mouth 1.7 per annum. But this does not tell the whole story. A part of the free States were very large exporters of pork. Many of the Southern States were, on the contrary, large importers from the Northwest. No one of them exported any considerable amounts of pork, so that the laborers of the Northwestern States must have been deprived by export of a large proportion of their 0.6 of a hog per month, and the Southern negro must have eaten that portion and all his own hog and 0.7 besides.

Again, in 1860 the slave States had 3,891,795 horses and mules. The Northwestern States had 4,335,246.

The annual earnings of the free States, including all the branches of agriculture, mining, manufactures, and the whole value of live stock, were, in 1850, only \$98.67 per head for the whole population. The same year the same industries in the slave States yielded an increase of \$108.35 for each soul, including the African Americans. This is a difference of about 10 per cent in favor of the slave States. We ascertain in the same way that the difference in favor of the slave States for 1860 was 16 per cent. So I might go on and show you from the returns to the census of 1850 and 1860 that in almost every line of production based upon agriculture, and of general production for that matter, that the slave States were producing more than the Northwestern States with the free labor. These are facts. How can they be explained except upon the theory that African slave labor, as organized at that time in the South, was highly productive? It is well known that the poor whites of the South, including small white farmers of the mountain regions, contributed comparatively little to the production of these States. We must give the negro the chief credit for these results. Trained and directed by the intelligent white man, the negro made the best agricultural laborer that man ever used in a semitropical climate. Under suitable conditions and proper direction negro labor has always been most productive. In this system white owners and directors of the negro laborer did not deserve all the credit. The negro must have his share and a large share of the credit for the marvelous productiveness of the plantations of the old South.

If the white race was demoralized by the great change, how much more was the negro? Thrown out of the old conditions in which he had been born and bred, wandered away from the old plantation where he learned to work, cajoled and lied to by demagogues who merely wanted to use him, humbugged and deceived by everybody who wanted his small earnings, neglected by everybody except a few of his old masters, no wonder the poor negro became demoralized, and so degenerated very rapidly as an agricultural laborer. He has not recovered from this treatment yet, and will not do so for a long time, but to a great extent he is the same man he was in 1850 and 1860. With proper education and training he can be made even more useful and productive as a citizen of the Republic than he was as a slave in the South. The great question is, how to do it. General Armstrong and Booker Washington have given us the most intelligent answer: By industrial education; not by a little schooling in books, but by training him to work as he has opportunity.

The key to the solution of the negro problem is a right conception of the nature of the race. The negro is a child race, at least 2,000 years behind our race in development. He is docile, kindly, faithful, and obedient in small matters; but his animal nature is still very strong, and he has not yet developed the intellect or power of self-control equal to the white man. He has improved prodigiously during the five or six generations he has lived in our midst, but no race can in 250 years overtake another with the advantages of several thousand years of civilization behind it. In all our plans for the improvement of the negro, but especially in our plans for his political and social training, let us not forget that he is a child who must be kept in leading strings, educated and governed possibly for hundreds of years before he can stand beside the white man in all things political and industrial.

Q. (By Mr. LITCHMAN.) How far is that modified or influenced by miscegenation?—A. I think that injures the negro; of course it debases the white man.

Q. You do not agree with Minister Wm that there should be an intermarrying of the races?—A. No, sir; I think theirs is a totally different race from ours.

There has been a very interesting study from the census from that standpoint by a gentleman whose name I can not recall just now, for one of the great universities, either Hopkins or Harvard, who published a book on the subject, showing how the race has degenerated in health, figure, and morals, and so on, through mixing with white people. I was over in Europe this summer and met a Dutch doctor. While he was talking to me he suggested this solution of the problem, "Why don't you intermarry, as we are doing out in East India? We send our young Dutchmen out there and they intermarry with those people up there in Java and those islands, and they are building up a fine race of people. Why don't you do the same thing." He took that view of it—very naturally—a scientific man. I had to explain to him that they were too far behind us. They don't breed. Those mulatto women are not fruitful—have not the health, and most of them get pulmonary troubles or syphilitic troubles and are more delicate than the rest. They are more like what Jersey cows are to the bovine breed—a delicate race. I can not speak very accurately now; it has been a good while since I read that book; but that is the impression or the recollection I have of it.

In conclusion, gentlemen, the place for the negro in the immediate future is upon the farms and in the smaller shops, where he will be occupied with the simpler trades. He has a fine chance in the South as a small farmer and gardener. There is abundance of land available for him. Therefore, above all things, he should be educated in agriculture and the other industries of the rural community. The negro must work out his own destiny for himself. He must get his training through work. Not even the Creator himself, and I say it reverently, can make the child into the man all at once. The child must grow into the man by regular steps. So the negro must through centuries of work achieve for himself the right to become the industrial and political equal of the Anglo-Saxon.

Q. (By Mr. A. L. HARRIS.) Is the negro as a farm hand reliable?—A. Well, you have to look after him. His moral principle—his sense of honor—is bad, and the attention to business is not developed like the white man; you have to look after him just as you do a child. He is very docile and willing, and if you humor him and will treat him like a child—a great deal can be done with the negro by kindness—humor him, give him good food and teach him how to get it, and make him a present now and then, speak kindly to him, and be a father to him. In other words, the Southern people have learned how to handle him, and others are learning very rapidly that go down there.

Q. Are there exceptions to that rule with the negro farm hands?—A. Yes; of course there are, some of them.

Q. Any of them qualified to be foremen or overseers?—A. Oh, yes; you can generally pick out enough to answer your purpose and train them up yourself after a few years, if you take the most intellectual and best ones. In speaking of the negro race we have to take cognizance of the fact that we have several races in this country, and if you will study that fellow he is a Guinea negro; got big, thick lips, and is a different breed of animal by thousands of years. Then there is the fellow from the Kongo and the fellow from back in the country, the man of Booker Washington's type, and others. I have seen some regular princes. I remember one on my grandfather's place—Pompey. There is a tradition in the family, I believe, that the ancestor who bought him down on the James River (?) from some slave ship told him that he was a prince from Africa. He was a different animal, that was perfectly plain. Different races of people—I think we have got to study that out. They were brought over like a lot of cattle—fastened down under decks, you know—and landed here in such shape that they do not know who they are and where they came from. There is, however, a difference between the races, and there are some very superior men among them and others are very much lower.

Q. As a rule are they able to handle improved farm machinery?—A. They learn it. The negro is naturally a good rough mechanic; he learns a process pretty well, and they are handy; they are not accurate and careful. You can usually teach them how to do work, but they do not make good skilled mechanics; they may make something of that sort by training.

Q. (By Mr. LITCHMAN.) Is the use of modern improved machinery general in the South?—A. Becoming more and more so, yes; on the larger plantations particularly you would be surprised to see the extent of its use.

Q. (By Mr. A. L. HARRIS.) Does his want of skill retard the introduction of improved farm machinery?—A. No; not that. It is want of means to get it; it is want of providence that has held them back in that respect.

Q. Does he get the knowledge by principle or imitation?—A. Imitation chiefly. You can say they know the theory from the employers pretty much. They learn from working with them and handling them, and they go and see a white man work one and soon learn.

Q. (By Mr. LITCHMAN.) Do you think the negroes less capable of being taught how to handle machinery and how to do the other work around the farm than that portion of the white population formerly known as "poor white trash?"—A. Not so much difference as you think. Yes, even that "poor white trash" have got some education—probably got a little knowledge of arithmetic. Unfortunately it is true that the public schools for the whites are better than they are for the blacks, simply for want of teachers who had been too much with the black people to teach the black schools, and they have not been educated to the same degree.

Q. Have you a paper on education?—A. Yes, somewhat along the same line.

Q. (By Mr. TOMPKINS.) The Doctor has stated that the field for the negro is practically agriculture, and I think he possibly left some impression for agriculture only. Well, I know he is aware of the fact that the cotton-oil industry is practically in the hands of negroes as laborers. That is true, is it not, Doctor?—A. Yes, sir. My idea is their immediate future is upon the farm and in the smaller shops where they work at simple trades; I mean the simple industries.

Q. The fertilizer industry is practically manned entirely by negro laborers?—A. That is true.

Q. And certain cotton mills, are not their hands all colored laborers, and perhaps other equally important industries, are not their hand, all negroes?—A. Yes.

Q. And the iron industry, you are aware also, perhaps, has as many negroes as white people?—A. Yes.

Q. In coal mining, perhaps, there are more negroes than white people?—A. Yes. All these come under the simpler trades, you know.

Q. With reference to the negro as an agricultural laborer, is it not probably true that under the direction of intelligent and kindly disposed white men he is a better agricultural laborer than the average white man?—A. I think they get along better together and produce better results.

Q. Without that direction they are very much worse?—A. Yes.

Q. That it is a matter dependent upon governing influences and the intelligence of that governing influence?—A. Yes. The negro needs exactly that kindly direction of the white man.

Q. He needs exactly what a child always needs—somebody to give confidence and courage—and you have got to be kind with him?—A. And the kind of white people that will work under the white farmer of the South is a pretty poor man, or he would get land of his own. If the white man is of any worth at all, he can be his own boss and run his own farm.

Q. Well, a great many of the deficiencies in negroes as agriculturists—are they not largely due to the fact that there was no way of working under this general direction of white people, that they were left on the farms as tenants and left to their own resources, and in that they have failed every time?—A. That is it—practically no organization.

Q. That supporting influence, upon which they are absolutely dependent, has been wanting?—A. Precisely. As the large plantations are being divided up and more people are going into agriculture as an individual occupation the value of the negro as a laborer is becoming more and more important every day.

Q. (By Mr. KENNEDY.) Doctor, did you attend any of those conventions that were known as the Knoxville convention, the Chattanooga convention, and one held somewhere else?—A. I attended several of them, yes—New Orleans; I had to deliver speeches before them—the New Orleans and Knoxville conventions.

Q. We had a gentleman before the commission—two, in fact, who were officers of these conventions. One of them gave us the impression that there was a very strong prejudice in the South against organized labor, and the walking delegate, as they call him, and that they intended to keep organized labor down—prevent labor from organizing, and that the negro was the great reserve force of the South that would be called upon for that purpose. Is there anything in that?—A. Those gentlemen were talking from the standpoint of cotton manufacturers. There is something in that. The negro doesn't organize that way; he is not developed up to it, and we do not have any strikes and have not any of those unions or organizations even among the cotton-mill people of the South; and I state this, I do rely with great confidence upon the negro as a reserve to keep out foreigners. I myself thoroughly believe in labor organizations as defensive, protective, and educational methods. I think the time will come when the negro will be educated well enough to join them, but it is a long way off. Yes, there is something in that.

Q. (By Mr. CLARKE.) I would like to inquire of the witness if the colored men, since assuming responsibility for their interests, are not developing ability to manage and making quite a rapid development in that way?—A. Yes, sir; as they

are getting more education, more business training, they are. Some of them are developing into excellent foremen and organizers of hands. You can get a great many pretty fine negro men to be foremen on contracts and buildings and big farms and on day labor. There is a man in my town, for example, who is a contractor—a great big black fellow; he is a totally different looking man from those common negroes—with a great big head on him, a fellow of brains. He is a big and very wealthy man, doing contracts of all kinds, earthwork, sewers, buildings, too. It is a wonder to us how he gets it done; he has not much education; he can figure a little, as he says, keeps a pay roll, and all that sort of thing. He hires an educated negro to keep his books, but that fellow has got remarkable executive ability. I know a great many just such common Southern negroes; they learn it by practice.

Q. Under the patriarchal system they were not obliged to do it—not taught to do it?—A. There are a great many splendid foremen on the Southern farms.

Q. (By Mr. CLARKE.) But the most were not taught to read and write and cipher, were they?—A. Well, upon the best farms of the Southern Atlantic States they were, to a certain extent, by members of the family; especially the house servants all learned to read.

Q. But the laws of some of the Southern States prohibited it?—A. They did, but the people did not heed that very much. In fact the people of North Carolina—the people in the house—were taught to read, regardless of the laws.

Q. Is it not true of the negro as of the white man—if he must learn to swim he must swim?—A. Precisely.

Q. (By Mr. STIMSON.) You spoke about miscegenation, and I was curious to know what the tendency of legislation was in the South. I find in 1886, which is 15 years ago, all the Southern States practically prohibited absolutely marriages between whites and negroes, and that the only Northern States which did that were the States of Indiana and California; and that, of course, is pretty stiff legislation, to make it a criminal offense. Now, I want to know whether those laws are still maintained or whether there is a tendency?—A. (Interrupting.) They are maintained, and I think will be.

Q. Are they enforced?—A. Yes; people are going to stand right there—the Southern people, the old element of the South, and the Northern—the more intelligent Northern people that settle in that country, all come to our point of view about these things. You take the people who go down—a great many from Ohio, Indiana, and the Northwest—we have got in our State a very great influx from the Northwest, who went out to the Dakotas and the Northwest, and during the period of hard times, when wheat fell off, a great many of those came down South, and those people soon took our point of view about these things; even politically they join our people, and I think that the American, the Anglo-Saxon, who knows the negro, is going to stand right there for a long time.

Q. Have those statutes ever been tested constitutionally?—A. No, sir; I do not know of any discussion of that in the Southern States.

Q. I should very much like to know now—you just stated the tendency of the negroes to get into positions of more importance, overseers, etc. As you said, of course, nine-tenths are still agricultural laborers, but there are some engaging in other lines of industry. Now, what I want to ask is whether there is as yet any jealousy in the South, as it is asserted there is in the North, on the part of the trades unions and so on against negro labor in industrial pursuits—iron workers, builders, carpenters, and that sort of thing?—A. In the cities there is some little. I had this experience: There was a boy, the son of a colored man and woman who were servants in my family, who grew up to be a very likely fellow, to use the language of the country, very intelligent, a very excellent boy waiter in the house, and so on, and I encouraged him to learn a trade. He got a position with a plumber in my town. He worked along up to the position where he was prepared to become a master plumber, but could not get any further at all; they would not let him in any of the unions. When he started out to do work for himself he was blocked completely; he could be a workman, work for another man, and become an excellent plumber, at least as good as any in the town, at least for that sort of work; he was an excellent young man in every way. It was stated that he had some Indian blood. His father was a very remarkable man, with a great deal of intelligence and character; he was much lighter than the average of his race. This fellow could not do anything, and finally left the country and came up East here and took a position in a hotel as a waiter and so on, and abandoned the profession entirely, and is up North here in a hotel, so his mother tells me. Now, I have known a number of cases like that in cities. There is a prejudice among organized laborers; they will not admit negroes to membership, and they would not give them a chance to get work as contractors; but that does not extend to

the small towns, and you would not find it all in the country. A good negro carpenter or blacksmith or mechanic can get a contract in the country and in the small towns as well as a white man; perfectly free, I think. That is the result of the introduction of imported labor-union ideas into our large cities.

Q. I should like to know in a word what becomes of the produce of this industry that you spoke of in the first part of this address. In other words, is the negro paid in cash?—A. He is beginning to make a good deal of it himself for use on his farm; the idea is to make your own meat and grain so as to feed your own family, and milch cows, poultry, and so on, and a great deal of it is used that way. The negro farmer gets the benefit of it where he is the tenant; he is supplied with beef, corn meal, or bacon made at home, lard and so on from the owner's supply; from the granaries or mill or his slaughterhouse, the usual methods; though the great advantage comes in where the negro and white farmer alike use the supplies right at home upon the farm where they are grown, where no middleman comes in at all.

Q. (By Mr. PHILLIPS.) I would like to ask one question. Is there a tendency, where the negro population is very dense in the South, for the white people to move away from that section and leave possession to the negroes, or is there not?—A. Well, there has been some talk about that. I do not think where they have moved away it is due so much to the negro as it is due to the climatic conditions. In my old home in Prince Edward County, Va.—that county has been very much abandoned by the whites, not because negroes were there, but because the land was very poor, and remunerative crops could not be made now, and the negro bought the land and settled there, because he works by simple methods, and his wants are fewer and his needs for education and society and all those things are fewer than the whites.

Q. Not on account of the antagonism of the race at all?—A. Not at all; very little of that. On the other hand, there are in the South some very fertile places where the climate is bad, very malarial—portions of South Carolina, portions of the black belt of Alabama, portions of the river-bottom country of Mississippi also have been improved by the negroes which they hold under the direction of proprietors and foremen, and the climate suits the negro better than the white man. He is not nearly so subject to malaria, and the climate does not affect the negro at all apparently—he is healthy and hearty and greasy, and rather favors the climatic conditions there on the poorer lands.

Q. (By Mr. FARQUHAR.) Is this commission to judge from what you stated that the revolution that came through the war in the South, disastrous as it was to the people, has been of ultimate advantage to the South?—A. I think so, decidedly.

Q. You think it has?—A. Yes.

Q. Better than the old system?—A. Will be. The South was splendidly organized under the old system for agriculture on a great scale. It had the best organization which the world ever saw, with the slave, and it was historical; it was the only way to bring the slave up and prepare him for the new liberties; no other methods on earth, gentlemen, could ever have taken a savage and made a civilized man out of him in 200 years, except that of domestic slavery. Of course, it was best only through domestic slavery, where the early Anglo-Saxon carried on farming; it was worse where the slave had to put up by himself, and the more the negro came in contact with the white master, the better it was for that negro, but there was no other system of labor that would have brought him up as fast as that of domestic slavery did and prepared him for the future, looking at it from a scientific standpoint. It was in the providence of God a revolution established to lift the negro up; we brought him over here, and as it happens he answered his purpose. For a time we used this agency to develop and prepare him for American citizenship, but we did not keep him quite long enough. I think it would have been better if they had been released gradually as they were in Brazil. I think the greatest crime possible that has ever been committed against the negro was to set him free all at once, and not give him anything on earth to do—turn him loose a beggar on the face of the earth and put the ballot in his hand. Such is our sentimentality, our passion about the thing as a result of agitation, as a result of the civil war, that the people at large were not willing to do the thing gradually, which would have been a great deal better for the negro. Of course, that is all done now. I say he should have been set free at a certain age to give him a chance to get some training. He ought to have been started out with something or other the same as the Government did with some of the whites—practically gave them 160 acres of land free. They ought to have made the same provision for the negro man.

Q. (By Mr. PHILLIPS.) Well, do you not think they would have been elevated

more rapidly if they had been dominated by the Anglo Saxon in their own country?—A. In Africa?

Q. Yes.—A. No; it would not have come to pass so soon. The English race is just getting hold of Africa. The time would have come in the distant future when it would have been brought up, but the white race is just getting there; they are just getting a railroad through Africa.

Q. (By Mr. FARQUHAR.) You spoke of an opportunity there to get 160 acres of land. Was not that equal to the black and white?—A. Yes.

Q. Didn't they go to Kansas and in the Western States and buy land?—A. Some have.

Q. Those that could go?—A. He was not able to go.

I think that the slave organization of the old Southern plantation was for the agricultural production the grandest system the world ever saw. I am convinced the South would have gone on producing at that tremendous rate and multiplication of slaves, and even our magnificent Northwest, with its splendid agricultural resources, could not have done it.

Q. Is that predicated on the idea that you should have slave land in the West, or confined to the old compromise land?—A. Been confined to the Southern States—been 30 years or more. There has been plenty of room for the development of Southern lands.

Q. What was the development of the white population in the South?—A. Well, slavery acted as a disadvantage to them.

Q. How much disadvantage?—A. A fearful disadvantage.

Q. Suppose you had continued 30 or 40 years more that system—what would have been the condition of the South—of the whites?—A. What, the poor whites?

Q. Poor whites.—A. Almost as bad as that of the negroes, if not worse. That is purely from the standpoint of production. I am not considering it from the humanitarian standpoint at all. I believe it is a glorious thing for the white man in the South that the revolution came when it did; a fearful thing for many years for the negro.

Q. You speak of the possibilities of the black race going into cotton mills and textile industries and everything of that kind. Why not provide for the whites before you provide for the blacks there?—A. Well, we are to a certain extent. We are already through that Southern Appalachian country, and around Sparta, and the North Carolina district, and the cotton mill operatives are the poor whites of that country.

Q. Is not the cotton mill the only field you have open there in the last few years for the labor?—A. Those people, if they had training, if they would work on the farms as they work in the mills, would do well farming, fruit growing, and so on. It is because they are untrained. They need leadership just like any other untrained race of people. They are like the negro, they want to depend on bosses; want somebody to think for them and direct them. The whites of that class are found in every community.

Q. You are provided with a number of training schools for industrial training for the blacks?—A. Yes.

Q. How many for the whites?—A. A few, not many; more generally for the industrial education and general education for the blacks than for the whites in the South. Owing to the facts of the philanthropic Northern people and the noble self-sacrificing Southern people, the aggregate result is more for the negro in industrial education than there has been for the whites. That is what we need in the South, industrial education for the poor whites. That is what I am going to appeal for directly.

Q. (By Mr. LITCHMAN.) How far is the negro becoming a landowner in the South?—A. Why, I have not the figures with me, but he is gradually getting hold of the land—very gradually getting hold of the land, I think, and he is going to get more and more of it.

Q. Have you not quite a number of wealthy negro people in the South?—A. Oh, yes.

Q. Who have acquired a competency since the war?—A. Yes.

Q. And the number seems to be increasing?—A. Yes. I know a number in my own town in merchandising, building, and contracting; and this fellow Anderson—we call him—has the best reputation of any contractor in town for figuring and business methods, and they say he is making money as rapidly as anyone there.

Q. I find in the New York Times to-day a reference to a report from the Montgomery Advertiser in relation to the movement under the patronage of the faculty of the Tuskegee Institute "to encourage the buying of land, to get rid of the one room cabin and the abuse of the mortgage system, to promote raising food-sup

plies, building better schoolhouses, lengthening the school term, getting better teachers and preachers, and improving the relations between the races." Do you know anything of that movement?—A. Oh, yes; a great deal. I know Mr. Washington and have occasionally conferred with him. I have read all his publications and all the accounts of his work; his conferences, and so on, there at Tuskegee. He is trying to educate the people along those lines. I do not know of any organized business movement to bring it about, unless he started one at his last conference, which met in February.

Q. Do you know whether that has the patronage and support of the influential white people in the South?—A. I do not know that it has, as I say, been organized yet—that they are actually helping them in a business way—but I think it would have their sympathy and support.

Q. There would be no opposition?—A. No; none whatever. Certainly increasing the improved condition in agriculture and increasing the price of land would be beneficial in the long run to the whites.

Q. (By Mr. A. L. HARRIS.) Let me ask one question here. In your opinion is or is not the negro a hindrance to the development of the South, industrially?—A. I do not see how we could get along without him. I believe he is in the right place and is going to stay there. He has not been in the past what he ought to be, but he is improving, and I do not see how the agriculturists could get along without him, possibly. I think he is, agriculturally, the most important factor we have.

Q. (By Mr. PHILLIPS.) Better than the immigrants from foreign countries?—A. I think so. He is willing to work, in the first place, and then it is very doubtful whether they would stand our climate as well as he does.

Q. Does his presence there prevent immigration to the South?—A. Oh, it prevents the poor white laborer from going into the section where the negro is in control, where he has the industries all in hand. You can not very well get Germans or Swedes or even Italians to work on the same plantations. Italians will come nearer.

Q. Even the farmers from the north of Europe would not want that place?—A. Not a bit.

Q. The farmers?—A. Oh, yes; the farmers and landowners go into the farming country a good deal. There is plenty of room for them down in the Appalachian country, but small farmers, stock growers, dairymen—there are a great many of them and we ought to have more, but we want above all native-born Americans. The best people we have are those that come from Ohio, Indiana, Illinois, and the great Northwest. They are the very best citizens. There is one who is one of the finest farmers in our section.

I am going to present some thoughts here upon education in relation to agricultural production and general production in the South.

There is an increased interest in public schools as well as in industrial education. We have Georgia, for example, increasing her appropriation for public schools. South Carolina is agitating it, and so on all along the line. There is a strong movement to increase the efficiency of the public schools by giving them more money, providing better teachers, etc.

EDUCATION.

Every lover of his country must rejoice in the great interest in education manifested recently in the South. It shows that we have at last come to recognize the deficiencies of our system of education and the one-sidedness of our present schools. The recent agitation for technical education grows out of the desire of the people to work up their own resources, like their cotton, wood, and iron, and produce more wealth.

Are we not in danger of taking too narrow a view of this subject? If increased production is our aim we must begin by educating all of our people in the public schools and not merely a few of them in technical schools. As patriotic men and women we want to see all of the people earn more so that they may live better and happier. The difficulty with our system of education in the South thus far is that we do not pay enough attention to the common schools. We have given most of our thought in the past to the higher education and too little relatively to the education of all the people. A complete educational system is like a pyramid—its base must be broader and stronger than any other part of it. Our present educational system, as far as we have any at all, is a column with a beautifully carved capital upon its top which is altogether too large for the base and the shaft. The reason our institutions of higher education are not attended as largely as those of other States is because they have too few public schools to support them.

Again, the education which we give in our public schools is not of the right kind. So long as the boys and girls who graduate from them are fit for nothing but bookkeeping, typewriting, and newspaper reporting, and are positively disqualified for business or manufacturing, there must certainly be something wrong. The common school education should lay a foundation upon which the person could build any ordinary profession. It should give a broad basis to make an intelligent artisan, as well as a bookkeeper, and fit the one to go on and become a skilled engineer, as it does the other to become a good lawyer.

Technical education is important, but we should not forget that universal public education is more important. Let us begin at least by putting manual training and scientific branches in the high schools, where all the children can have an opportunity for the broad training. If greater productivity is our aim we must first have the better common schools. If we content ourselves with a few technical schools here and there we will be greatly disappointed.

I want to quote here some remarks that I made at the convention of the Southern Educational Association, at Richmond, not long ago, which have been printed in a little circular, if you will pardon me for introducing printed matter.

Mr. PHILLIPS. Oh, certainly.

PUBLIC EDUCATION AND PRODUCTION.

My first proposition, then, is that if we desire to make the South more productive we must begin by building better public schools. (Reading:)

"The chief characteristic of the nineteenth century has been the extension of the benefits of education to the masses of the people. Its chief lesson is that education increases the wealth-producing power of a people in direct proportion to its distribution and thoroughness. In fact, the relations between education and productivity are so well understood now that you can measure the wealth-producing power of a people by the school privileges which they have enjoyed. Statistics show, for example, that the power of the people of the different States to earn money is in direct proportion to the length of the period the average citizen of each has attended school. To illustrate, the average school period in 1898-99 of each inhabitant of the United States was 4.4 years; of Massachusetts, which has the best schools, was 7 years; of Tennessee, was a little less than 3 years. The total annual production of the United States in the year 1800 was less than \$30 a year, or 10 cents a day, counting 306 working days in the year, for each man, woman, and child. By 1850 the production had increased to nearly \$92 a year, or 30 cents a day, and in 1899 it was about \$170 a year, or 55 cents a day. The production of Massachusetts in 1899 was \$260 for each man, woman, and child, or 85 cents a day. The most favorable figures make the total annual production of the people of Tennessee in 1899 less than \$116 a year, or 38 cents a day for each inhabitant. Another way to express it is to say that the average family of 5 in Tennessee must live on \$580 a year, counting everything produced on the farm and in the home, as well as sales and money wages, while the same family in Massachusetts has \$1,300 a year to spend, and the average family of the United States has \$850. Put these facts together and we at once see their tremendous significance."

See how far behind we are. I have used Tennessee in these comparisons because it is my own State and I have got a right to speak about it. I may say that it is not the worst off of the States in the matter of public schools by any means, although it is one of the backward ones. North Carolina, South Carolina, and Alabama are lower down in the scale than we are, but Tennessee represents about the average Southern State, and I will use it for the purpose of comparison.

"The proportion between the school period in Massachusetts, the school period in the whole United States, and the school period in Tennessee is expressed by the figures 7, 4.4, and 3: or, multiplying each by 2, by the figures 14, 8.8, and 6. The proportion between the productive capacity of each person in Massachusetts, in the whole United States, and in Tennessee is expressed by the figures 260, 170, and 116: or, dividing by 20 to bring to terms similar to the others, we have 13, 8.5, and 5.8. Think of this. Education is as 14 in Massachusetts to 8.8 in United States to 6 in Tennessee. Production is as 13 in Massachusetts to 8.5 in United States to 5.8 in Tennessee."

In this wonderful parallel showing the opportunities for public education and the figures showing the resulting production, these figures are obtained from reports of the State commissioners of education and the National Bureau of Education here in Washington. The figures for production are obtained from the reports of State controllers and entirely different sources, and I have only put them side by side and boiled them down, and there is the grand result. It is not the technical education that does for the whole people; it is the public schools.

"This is not a mere coincidence in the case of Massachusetts, the United States, and Tennessee; it is the law the world over. The productivity of a people is everywhere proportional to their education; that is, their intellectual, physical, and moral training. It is not the natural resources, the climate, the soils, and the minerals; it is not even the race, much as these things count in production; but it is education which above everything else determines the wealth-earning power of a people."

The Southern people have made great sacrifices for public education and especially for the education of the negro, but they must prepare to do even more if they are to keep up with the other States in production. The States represented in this association are still far behind the Eastern and Western States in the manner in which they support their public schools. Let me take for comparison the best school State in the Union, Massachusetts, and my own State of Tennessee, which represents, I find, the average conditions in the South.

"The population of Massachusetts is 2,805,346; of Tennessee is 2,020,616. They have the same number of children to educate. The enrollment and the average daily attendance on their public schools in 1898-99 were as follows:

	Enrollment.	Average daily attendance.
Massachusetts.....	471,977	360,317
Tennessee.....	499,846	332,734

"Massachusetts taught school 188 days in the year and her enrolled pupils attended an average of 143.5 days. Tennessee taught school only 89 days and her enrolled pupils attended only 62.8 days. The average Tennessee child is absent 26.2 days in the 89 days of the school session.

Massachusetts expended for all purposes of her public schools in 1898-99 \$13,889,838, which was \$38.55 per pupil in average daily attendance and \$5.07 per capita of her population. Tennessee expended for her public schools in the same year \$1,628,313, which is \$4.62 per pupil in average daily attendance and only 83 cents per capita of population. The average expenditure for all the States of the Union is \$19 per pupil in average daily attendance and \$2.67 per capita of the population of the entire country.

The power of education in production may be presented again in this concrete way: From the statistics above it is seen that Massachusetts spent in 1898-99 \$12,261,525 more upon her public schools than Tennessee. But see what a return she gets. Each one of the 2,805,346 citizens of Massachusetts—men, women, and infants—has, as we have said, a productive capacity of \$360 a year against \$170 a year for the average inhabitant of the whole United States and \$116 a year for the average inhabitant of Tennessee. The inhabitant of Massachusetts has thus an excess of \$90 a year over the average inhabitant of the United States and \$144 a year over the average inhabitant of Tennessee. This means that the people of Massachusetts earned last year \$252,487,140 more than the same number of average people of the United States and \$403,969,824 more than the same number of people in Tennessee. Twelve million dollars invested in superior education yield 400,000,000 a year!

There is no comparison between the natural resources of Massachusetts and Tennessee in respect to timber, climate, soil, mines, and everything of that sort. Massachusetts has an advantage in waterways to a certain extent, but on the whole, I suppose, one would say that Tennessee had a tremendous advantage naturally. In conclusion, I made this appeal to the Southern people:

"If the people in the South would compete in production with the people of the other States and of the world—and they must do so whether they will or not—they must educate all their children; not only their white children, but their black; and they must educate them all, not poorly for a few months in the year and a few years in their lives, but thoroughly through a long series of years. If history teaches us anything it is the solidarity of all mankind, that 'no man liveth unto himself,' and 'no man dieth unto himself,' but that we are each his 'brother's keeper.'

"Our great resources, climate, soils, and minerals, are useless in the hands of an untrained people. Moreover, if we do not educate our own people to use these resources intelligently, the trained men of other States will come in and do so, and make our native people 'the hewers of wood and the drawers of water' in their industries.

"Some persons seem to think that the marvelous energy and common sense of our people are a sufficient guaranty of their success in the battle of life. But

common sense and even unmeasured energy do not win in these days without education. We must give our people knowledge and training or they will surely fail in the hot competition of the twentieth century. Will we not realize that our best resources are our own children and that our highest duty is to educate them for the greatest usefulness in life?"

Q. (By Mr. PHILLIPS.) Does not the fact of Massachusetts being a very large manufacturing State account for part of this earning capacity over Tennessee?—A. Because for a century she has been educating her people; that was not brought in.

Q. Do you think the manufacturing interests that are established in Massachusetts are due to education?—A. Oh, I think so; very largely.

Q. Compared with Tennessee?—A. Oh, yes; I think so. You take the town of Worcester, for example. What resources do you think of for building up the great manufacturing town of Worcester? No resources there; no minerals, no ores, no coal, no transportation service; inland town; railroads, of course—we have them everywhere. What was it that made Worcester? Go back and study it and you will see that it was technical knowledge and education of the people right there that built up all that industry. So you go around Massachusetts and study the public education and technical education. Technical education itself has made it necessary to the manufacturing interests—they had to educate their people. They could not live without it. They would have struggled along until 1865 or 1870, but where would Massachusetts be to-day if it were not for the technical knowledge of her people? She would not have a tenth part of what she has got now.

Q. (By Mr. A. L. HARRIS.) I would like to ask one question, whether or not there is a disposition in some of the States of the South to curtail the education of the negro instead of increasing it?—A. I do not think that is serious. There may be a few people talking about it in the newspapers. I have seen some statements of that kind, but I do not think it is at all serious. On the other hand, they are doing everything in the world they can.

Q. Is there any sentiment to divide the school fund and allow the negro population to use that which the negro pays in?—A. Some suggestions are made of that in Georgia and some other States, but I do not think it is entertained seriously. It is just from a few politicians who always feel their way to see if they can not suggest some new platform or some new doctrine that will give them a little notoriety or power. I do not think it is seriously considered in all the Southern States. They would not dare to do it.

Q. (By Mr. TOMPKINS.) Is there developing any of the other sentiment—to educate the negro?—A. More and more; more and more. We are feeling more and more, I think, that we must educate them; that we can not get along without them. That is the corollary to what you asked me before, if they were an obstruction or burden. We must have them. The whole of the thinking people of the country are all moving in that direction. We have another conference soon, some time in April, I believe, in Salem, continuing this series of conferences that was held up here in Virginia. The people are getting together and will get together in Salem in April to consider these very matters—how we can improve and advance the condition of the negro.

Mr. A. L. HARRIS. Mr. Chairman, before we get too far, I do not want to forget to suggest to the Doctor about the paper that he had prepared upon technical education that we wanted printed, and we do not want the questions and answers merely to go in in place of that carefully prepared paper. I want him to be sure to allow that paper to stand, as well as the other papers.

The WITNESS. I will.

(The paper referred to follows.)

Mr. TOMPKINS. Mr. Chairman, before the close of the testimony, I would like to make a statement in justice to myself. I have just completed a book on cotton and cotton oil, which covers to a considerable extent the questions of labor and education, and what I have said, without knowing in a very general way Dr. Dabney's views on this subject, is so much like them, that people might think if I did not acknowledge it here, that I had plagiarized his views.

(Testimony closed.)

TECHNICAL EDUCATION.

Having made provision for the elementary education of the people on this broad plan, we may wisely turn our attention to the technical education. A complete system of technical schools comprehends the following:

1. A system of trade schools in which pupils are trained for the leading arts.
2. Polytechnic schools in which instruction in the applied sciences and technical or professional training are offered more advanced students.

3. Institutes of technology or departments of science in universities in which the highest professional instruction in the applied sciences is provided.

There is no difficulty in accounting for our early indifference in the South to science and technology. It was in accordance with the history of science the world over and with the laws of its development in all countries. Up to 50 years ago we had all the science, or more, than we could use. We were engaged in getting out raw material, in "skinning" our soils, in cutting down our forests, and in working a few surface mines. Germany and France supplied us at first with our science and England or New England with our technical experts.

A young people always view their raw material as their chief source of wealth, and they are often too ready to barter it for a mere mess of pottage. When they become older they discover that it is not upon natural wealth alone, but upon the culture of the scientific intellect, that permanent prosperity depends. England was not a manufacturing nation until the Elizabethan age. Though coal, iron, and wood were found in abundance in the reign of the Plantagenets, they produced little prosperity. Their home-grown wool was sent to Flanders to be manufactured and turned into cloth. Spain, which had fallen heir to Arabian science, was the greatest manufacturing country of those days. When the Moors were banished and the political crimes of Spain led to its destruction as a nation, England took its position as the leading industrial nation of the world. The invasion of the low countries by Philip II drove the Flemish manufacturers, as the French persecution drove the Huguenots, to England, and they introduced the industries of cotton, wool, and silk in that country. In none of these countries was science a subject of study at this time. The acquisition of wealth must precede the cultivation of science. Technical skill is needed to utilize the raw material to the best advantage. The time comes, however, in the history of every nation when it must educate its people in science and train them in manufactures and industries or it will go down. This higher scientific education is the forerunner of higher prosperity, and the nation which fails to develop the intellectual faculty for production must degenerate, for it can not stand still.

In society, as in biology, there are three states. In the first, the state of primal equilibrium, things grow neither better nor worse; the second is the state of evolution or development, during which animals and plants adapt themselves to their environments and take on new characteristics; the third is that of degeneration, when they first stand still, then decay, and so go back to the earth from which they sprang. The same is true of nations. A nation may remain in equilibrium for a brief time in the early stage of its history, but it is impossible to hold its forces in balance when its environment is constantly changing. To stand still then is to die. The life of a people industrially is science. We must feed its fountains and keep them pure or growth will cease, industry will fall, and the nation will die. Our Southland stands at the beginning of the second state. We have lived as long as we can upon the bounties of nature and have reached that point at which we must study science, learn the arts, use our material resources, and accumulate wealth or else fall behind and go down.

The study of science and the application of science always have gone and always must go hand in hand. As a matter of fact, discoverers and appliers of science are often combined in the same person. The interests of pure science and of technology are largely identical, and science can not take a step forward without opening new fields for industry. New truth in science always leads to new developments in industry. Hence, we must have the inventor as well as the investigator. So, on the other hand, every advance of industry facilitates the experimental investigation upon which the growth of pure science depends. See how the glass industry has promoted the progress of chemistry, and how the electrical industry has in our own time aided physics and mechanical engineering. Pure science and technology can not be separated. Civilization began with man as a tool-making animal; it has grown with man as a machine-making being. It is not the classics or philosophy that alone makes a people strong, else India might have been the ruling nation of the world and England its province. Historically, technical progress did not follow the growth of science, but preceded it. Mining developed geology. Fisheries led to biology. If civilization owes so much to technical knowledge, why, then, does not that knowledge form a part of our higher education? It should and must, if we would keep step with the progress of the world.

It is not generally known that General Lee was a great believer in scientific and technical education. Says Professor Joynes, his colleague: "General Lee's plans for the development of Washington College were distinct and definite. He aimed to make this college represent at once the wants and the genius of the country. Under his influence the classical and literary schools of the college were fully sustained; yet he recognized the fact that material well-being is for a people a condition of all high civilization, and therefore, though utterly out of

sympathy with the modern advocates of materialistic education, he sought to provide all the means for the development of science and for its practical applications." The Southern people have still to realize the ideals of Lee in education.

No one shall surpass me in giving praise to the old-time college. For giving men character and classical culture it was perhaps unsurpassed in its day, but it was deficient in that it did not qualify all its students for all the work of life. We can not all be preachers, teachers, or statesmen, and the great defect of the old college was that it had no training for young men who had no taste for the classics, literature, or philosophy and were not fitted for the higher walks of professional life. It gave a one-sided education. As Emerson said, "We are students of words; we are shut up in schools, colleges, and recitation rooms for 10 or 15 years, and come out at last with a bag of wind, a memory of words, and do not know a thing. We can not use our hands or our legs or our eyes or our arms." The old college gave the youth splendid training in the humanities so called, but it was deficient in the study of nature. "The proper study of mankind is man," but man, his languages, literatures, and philosophies are not the only things in the world. Outside of man is the whole world of nature, and man has to live and work out his own salvation in accordance with the laws of this natural world. The same Creator made all things and declared them good. Man is, indeed, fearfully and wonderfully made; but nature is just as full of wisdom and of law and almost as fearful and wonderful as man himself.

About 1870 the necessity for reform in our system of college education became apparent to us, as it did to scholars in all parts of the world, for the defects mentioned were not peculiar to our country or to our time. The movement for scientific and technical education during the last 20 years was world-wide, and the changes made in college education in the South were only a part of and in harmony with the trend of modern thought and industrial development.

It was otherwise an auspicious time for a change of our system of education. A new day had dawned. In 1865 the South awoke suddenly out of medieval night and found itself in the midst of a scientific age and a day of tremendous material development. She commenced to appreciate for the first time her birthright of almost boundless material resources, and set bravely to work to build up her waste places and win back the wealth she had lost. She commenced asking herself, What good are coals, iron ores, zinc ores, hard wood, water powers, marbles, and such things, unless utilized? Why not train our own young men to manufacture these things into commercial products? Is not the fact that these things still lie in the mountains unused chiefly owing to that other fact that we have no men who know how to use them? Hence it was determined that Southern boys, at least, should have an opportunity to secure a scientific and technical education, and thus be qualified to assist in the development of the material resources of the country. As Huxley expresses it, "It is folly to continue, in this age of full modern artillery, to train our boys to do battle in it equipped only with the sword and shield of the ancient gladiator." The chemist's balance or the engineer's transit are better instruments for this time. In a scientific age and in an industrial section an exclusive education in the dead languages was a curious anomaly which we hastened to abandon. The flowers of literature should indeed be cultivated, but it is not wise to send men into our fields of industry to reap the harvest when they have been taught only to pick the flowers and push aside the wheat. We wanted to grow rich and strong, and here was an honorable and healthful way of doing so. As a result, therefore, of these considerations, practical as well as philosophical, there has been between 1870 and the present time a wonderful development in scientific and technical education in the South.

Such were the forces and the necessities which gave rise to an entirely new class of institutions in this section. After the wonderful growth of all kinds of schools in the South, the most interesting fact in our recent history is the rapid development of schools of science and technology. The report of the United States Bureau of Education for 1898-99 shows that out of 152 colleges and universities of general character in the South, including Maryland and Missouri, 16 have extensive technical departments. In addition to this there are, counting those for colored students, in these States 28 agricultural and mechanical colleges; 3 State schools of technology or mining, separate from these colleges; 6 local technical schools, and 8 separate military academies—making a total of 192 schools in these States giving good instruction in science or technology. None of these except the military schools existed prior to 1865.

Time would fail me to mention any of these schools or their work. The Virginia Polytechnic Institute, the Miller Manual Training School of Albermarle, the engineering department of the University of Tennessee, and the Georgia School of Technology are splendid representatives of this class of institution. Their scope and work are so well known to you that I may point to them without description as the best types of the kind of school that the South needs.

WASHINGTON, D. C., April 10, 1901.

TESTIMONY OF PROF. RICHARD B. WRIGHT,*President of the Georgia State Industrial College (Colored).*

The commission met at 2.42 p. m., Mr. Phillips presiding. At that time Mr. Richard B. Wright was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your full name, your address, and your occupation.—A. Richard B. Wright; teacher; College, Ga. That is the name of the town, near Savannah.

Q. How long have you been engaged in the business of teaching?—A. About 22 years.

Q. Are you a graduate of a college?—A. Yes, I am; of the Atlanta University.

Q. How long have you been connected with the Industrial College?—A. From its beginning; for 10 years.

Q. How was that organized, and when?—A. In 1891 it began its operation. It was organized under what was called the land-scrip fund and the Morrill fund. The land-scrip fund had been given previously to the Atlanta University, but was taken from the Atlanta University for the purpose of establishing this school, and so we get these two funds.

Q. What income, if any, have you?—A. About \$16,000 per annum.

Q. That comes from the funds you spoke of?—A. Yes.

Q. Does any assistance come from the State of Georgia?—A. Of course, all this comes through the State, but as a direct appropriation from the State we receive none.

Q. What is the number of teachers in your faculty?—A. We have 17.

Q. How many students?—A. We have 500 now.

Q. Would you give the commission, briefly, the course of study and training?—A. We have some 10 different trades. We teach the industrial trades, such as shoe-making and tailoring; and we teach painting and carpentering and blacksmithing, and we also teach sewing. We have just taken in girls, and we teach them plain and fancy sewing. We also teach agriculture. We give the boys training in that—in farming.

Q. Do you give any literary training?—A. Yes. Really it is a part of the University of Georgia. The main branch of the University of Georgia is for the whites, and this the branch for the colored people, and therefore has a complete college course.

Q. You are authorized to graduate and give diplomas?—A. Yes; we give diplomas. We give what is called the degree of A. B. Very few negroes take that degree, because they go out into their work before they have taken a sufficient course for the degree. When they have taken a sufficient course to enable them to go out in the various trades I have spoken of they generally leave.

Q. How long does it take to complete a course in your college?—A. That depends on the degree of advancement which the pupil has when he comes. We think that we can finish up most of those that come from the grammar schools in 3 years. We send them out to begin their work as tradesmen. Of course those that go higher than that have to take 4 years or more.

Q. What, if anything, is charged the student?—A. There is no fee, except his board and necessary expenses.

Q. How many years do you give in your industrial training?—A. We give 4 years in the complete course, from the time the boy comes. He must have attained certain literary standing, as well as an industrial standing. It is supposed to be a school for the purpose of training them to go out among the people and assist them.

Q. How efficient as mechanics are your students when they leave the school?—A. I might speak of a case that is perhaps a sample. A young man graduated in the school and was sent out to do work in the city. He went to work as a brick mason at about \$1.50 a day, and remained there for some little time and was advanced to the position of foreman. He then went to the town of Hawkinsville and began to work. He finally was put in charge of the work of erecting the courthouse at Hawkinsville. That young man and about 10 or 12 others are now engaged in erecting a large three-story brick building on our own campus. Boys coming there who have been making practically nothing have become good workmen, making from \$1.50 to \$3 a day.

Q. Have you a farm in connection with your college?—A. Yes.

Q. Have you buildings and equipment?—A. Yes; we have fair equipments for them. During the past year we have had 25 acres only as an experiment farm, to see how much we could raise on that. We made that farm pay about \$1,000, with

the student help and 1 man in charge of it. We have tried to show how much a person could raise on a little one-horse farm by special work.

Q. Is that devoted to general farming, or some particular line?—A. It is mostly trucking—truck farming, as it is called down there—the raising of various kinds of vegetables for the market.

Q. What would you estimate to be the value of your farm and equipment at the present time?—A. We got it in the woods—got it for little or nothing, and put the improvements on it. I can hardly tell what it would be worth now, but it is near the city and would be worth at the rate of perhaps \$40 an acre.

Q. How many acres have you?—A. We have about 50. I suppose our farm would be worth something like \$3,500, equipment and all. That would be a fair estimate. We are within 4½ miles of the city, and the value is mostly in the land.

Q. How many students have you graduated?—A. We have now graduated about 60 students.

Q. Is it for males only?—A. It has been up to within 2 years. We have just taken in females.

Q. The students that you graduate go into the industries that they have learned while in your school?—A. Yes; as a general thing. I should say that something over 50 per cent of them are now engaged in the very trades for which they were trained. Others have found other engagements. Some of them have gone to other schools and are still studying.

Q. You consider it important for the colored students to get the benefit of an industrial trade?—A. Decidedly so; yes.

Q. Now, you have a paper, I believe, that you have prepared to read before the commission. Unless you can think, or some member of the commission can think, of something further preliminary, you may proceed to read that paper.—A. (Reading:)

"NEGRO FARM LABOR IN GEORGIA.

"The labor system of the South at the emancipation was not only revolutionized, but practically paralyzed for a time. For the 5 years following the war, the struggle over the reconstruction of the States and the enfranchisement of the Negro not only kept the Negro labor of the South in a chaotic condition, but virtually so unnerved the white people of the South that they did not begin in dead earnest the rehabilitation of their section until 1870. Few people can realize the sad plight in which the emancipation of the slaves left the South. The transference of the title to \$3,000,000,000 worth of property from master to slave by one fell stroke of the pen was indeed a great transaction. It was a great loss in money. Under slavery, according to an official report to the Secretary of the Treasury of President Polk, the cost of feeding and clothing a slave was \$30 per annum, and the slave owner therefore made from \$100 to \$400 on each slave. But the transference involved not only a money loss, but the making of the slave the equal in citizenship to his former master. It did this, but it did not give the freedman his mule and 40 acres. The slave found himself without an effort of his own invested with the privilege not only to hunt, fish, and lounge around as he had seen his free master do, but clothed with the right to talk politics and vote as he had been told that his master had done. These privileges, denied to him by slavery, were now given to him by freedom. Words can not picture the full meaning of such a revolution.

"What was more natural than that the Negro, in his attempt to enjoy these privileges, should have misused them. He did not understand the struggle that was going on over the reconstruction of the States. The carpet baggers and their white associates were conducting this contest. That he should have consented to be used by the latter was his only alternative, as his late masters were wholly unprepared to treat with him on any other terms than that of quasi slavery. It is true, while slavery and the war lasted, that the Negro had shown his late masters an example of fidelity and generosity which neither the South nor the world can fail to admire. Indeed, few Southern orators to-day, especially those of the old school, fail to point with pride to the fidelity of their late slaves during the war time, and to their faithfulness and efficiency as laborers before the war. But somehow or other, the new condition brought about by emancipation was not greatly relieved by this fact of their previous good behavior. Prof. Woodrow Wilson, formerly a Southern man, declares that the Southern legislatures had sought, in the same sessions in which they gave their assent to the emancipating amendment, virtually to undo the work of emancipation, 'substituting a slavery of legal restraints and disabilities for a slavery of private ownership.' Thus there began a political contest, essentially between the laborer and his employer, which for a long time has absorbed a great deal of the energies which ought to have been devoted to the improvement of farm labor and to the development of the resources of the South.

"But I am glad to testify to-day that in the light of the progress of the past 10 or 15 years the statement above sounds somewhat like an extract from ancient history.

There is now practically peace and harmony between the races throughout the South. I am speaking of the laboring population. They have never learned the art of politics, and they are far less interested in them to-day than the white men who are striving to deprive the negro of the ballot. From a landless, homeless class of ex-slaves in 1865 the negroes in Georgia have become taxpayers to the amount, in 1879, of \$5,182,398; in 1886, \$8,655,298; and in 1900, \$14,118,720, including the ownership of a million acres of farm land.

"Hon. Martin V. Calvin makes for me the following comparison:

PROPERTY OF NEGRO TAXPAYERS, 1886, COMPARED WITH 1900.

	Number acres of land.	Value.	Household and kitch- en furni- ture.	Horses, mules, and other stock.	Plantation and me- chanical tools.	Aggregate property (including cities).
1900	1,075,073	\$4,274,549	\$1,655,092	\$2,424,674	\$469,637	\$14,118,720
1886	802,939	2,508,198	858,329	2,166,569	260,549	8,655,298
Gain	272,134	1,766,351	796,763	258,105	209,088	5,463,422
Per cent	33.8	70.4	92.7	11.9	\$0.2	62.1

"As compared with former years, this shows a condition of healthy improvement. In fact, bearing in mind the disparity between the condition of their intelligence, and the fact that the white people of Georgia began their post-emancipation period with practically all the property of the State in their hands, valued then at more than \$222,183,787, it must be acknowledged that the colored laborer has truly done well to save out of his scanty earnings during the past 35 years \$1 for every \$16 saved by his more fortunate white employer during the same period.

"There are in Georgia three classes of Negro farm laborers—the croppers or wage-earners, the renters or tenants, and the owners. The croppers or wage-earners get \$8 to \$12 per month with rations, home, and fuel. The tenants or renters pay a certain portion of the crop for the rent of land.

"But I do not intend to speak of the entire State. I have chosen a group of counties in the southern part of the State, generally known as the wire-grass region. There are 32 counties in this group, extending entirely across the State, below latitude 32°. In the past three decades this section has made great progress. I quote Mr. H. R. Harper, editor of the Rome Tribune.

"SOUTH GEORGIA'S GROWTH.

"Mr. Houston R. Harper, editor of the Rome Tribune, recently spent a week resting and recuperating in south Georgia and Florida. Commenting on the many evidences of enterprise and prosperity in south Georgia, and comparing it with north Georgia, Mr. Harper says: 'North Georgia is not growing as south Georgia is. The last census shows this. Everywhere down there new roofs are to be seen. New railroads are being built. New factories and new enterprises are going up. Every town has felt a rise of from 25 to 200 per cent in real-estate values. The writer, during a recent trip through Georgia, was especially impressed with the neatness of the homes—no tumble-down fences and paint-blistered houses, but everywhere visible signs of thrift, progress, and prosperity.' Commenting on the above, the Quitman Free Press says: 'It is confidently believed by conservative and thinking people that the wire-grass section is entering upon an era of development that will be unparalleled in the history of the State. There are vast possibilities of wealth in south Georgia that have not yet been developed, chief among these being the sugar industry.'

"The papers are taking up this question, and its agitation is sure to be of great good to this section. There is hardly a limit to the productive capacity of the soil, and when once capital can be enlisted in this enterprise south Georgia will grow in wealth by leaps and bounds.

"There has been noted, too, lately, the erection of a plant in Brooklyn for the utilization of wire grass in the manufacture of furniture and other articles. The papers state that the plant is now at work and is turning out some very artistic pieces of furniture as well as nutting and coarse twine and expects later to make rope out of this same material. I mention this to say that the supply of wire grass in this section I speak of is simply immense.

"The wire-grass region labor is practically colored. In 1870 there were, however, in this wire-grass region 98,221 white people and 96,206 colored persons, or 2,015 more whites than colored. According to the census of 1890 the whites had increased

to 144,893 and the negroes to 166,710, or 21,817 more colored than whites. The colored people in this section had in 1890 added to their number more than 70,000 and the whites a little more than 56,000. The increase of population in this section has been quite great for the decade ending in 1900, but it seems that the colored people are still in the majority. According to the comptroller-general's last report for the year 1900 the wire-grass colored people own 413,178 acres of land, nearly half of the farming land accredited to the colored people of Georgia. All of them began to work for small wages or part of the crops. Now only about 30 per cent of them are crop-pers or wage-workers; 60 per cent of them are tenants or renters, and 10 per cent of them own and work their own farms. The wages for a farm laborer in this section are very small, and consequently there is a great temptation to leave the farm and work on the railroads, the turpentine farms, and the sawmills. This section is perhaps the greatest naval supply center in the world and the work is mostly done by the wire-grass colored people. While there are a number of vocations to which the colored laborer can resort for a scanty living, the average wire-grass colored man is a farmer. His farming, however, is of the crudest kind. Except in rare instances he has no practical knowledge of improved machinery. He follows the same routine of farm cultivation pursued by his late slave master, who himself had never introduced labor saving machinery into his farming.

"While it is a fact that as a rule the land which has fallen into their possession is the old broom sedge or so-called worn-out fields, yet since the war the acreage of improved land has increased in Georgia from 8,062,758 to 30,971,518 acres, and with it the value of farm land has increased. This increase is due largely to the increase of the productive efficiency of free labor. Anyone who considers the circumstances under which the colored Georgian has come in possession of 1,075,073 acres of farm land and has gained over \$14,000,000 worth of taxable property, substantially in less than a generation, must experience some difficulty in subscribing to the truth of the proposition that the colored farm laborer will not work as well under the incitements of ambition and self-interest as he did under fear of punishment and as he will now when not under control.

"The wages upon the farm are so small, however, and the conveniences are usually so meager, that there can be little wonder that there is a general disposition among the colored farm laborers either to rent or buy land. The colored laborer feels that he can scarcely make less to live upon, and he knows that he will not have to work so hard.

"Some of the planters write me that when the colored laborer is properly treated, and he is not subjected to extortion and undue hardships, there is no more reliable labor to be found anywhere, considering its degree of intelligence. Poor wages and bad treatment are calculated to either drive the most efficient labor from the country to the city or to render such labor practically worthless. But the fact that there are so many fairly prosperous colored farmers in the wire-grass region is the best evidence of the truth of the statement that the best colored people and the best white people are there working together to better their condition.

"The criminal population of this section is not large. According to the report of the principal keeper of the penitentiary there are (out of a negro population of more than 166,710) only 673 negro State prisoners, and these are engaged in working at the turpentine industry, on farms, in getting out cross-ties, and on public roads and streets. I am satisfied that the employment of these prisoners in this class of work tends not only to lower the standard of living, to lessen the desirableness and profitability of such work by free labor, but greatly to lower the morals and efficiency of labor in the neighborhood. This cheap convict labor keeps down the price of labor so low that very few free colored laborers can do more than eke out a miserable living. The low state of morals and of sustenance superinduced by this condition tends to render hopeless any effort of the ordinary colored laborers to improve their condition. They are thus content to eke out a miserable living from patches instead of farms, and to get a pittance from odd jobs and such other work as that in which convicts are largely employed, if they can but get a little cash for it. Everybody must admit that this is a very undesirable state of affairs, a condition that is contrary to the best interests of the State.

"But it is hardly fair, I think, to assert that the wire-grass negro is a burden to the white man. There are 26,000 negro polls in this region from which \$1 poll tax is collected, and they own property valued at \$3,063,896. This property is taxed at the rate of 5.20 mills, and yields \$15,932.25, in consideration of which they receive police protection and an expenditure of an educational fund of \$12,328.16. Their schools run from 3 to 5 months, and have been of immense value to the negro, for they are administered by one of the best State school commissioners in the country. Yet I do not think that they have had the greatest effect in rendering the labor more efficient and productive. The colored man has had no teaching along the lines of agriculture and horticulture, the needs of plants and plant growth, how to use fertilizers, how to make the common tools and agricultural implements, as well as

how to best handle the improved farm and agricultural machinery. Nevertheless, a comparative view of the slave labor and the free labor is decidedly in favor of the freed negro. In the past 30 years the freed negro has increased his productive power at least twofold. He is twice as efficient as a free man as he was as a slave. He produces twice as much to-day as he did then. Contrary to the popular belief, the old slave negro laborer has proved a flat failure in freedom. There are very few cases of success in farming reported among the colored men before 1870. There are rare instances of success, but the record is against most of the old slavery time negroes, because they came out of slavery without any fixed or settled habits of labor—without control. While perhaps a majority of the negro property owners were born before the war, they are only in a very slight degree the product of slavery. The colored man who has worked his way up from the rented-mule stage of the cropper or renter to that of the proprietorship of a few goodly acres is the man who has spent the most of his years as a free man; he is the only man who has the ambition to own the few acres which he tills. Since emancipation there has been in Georgia an increase of the value of farming land, an increase of the number of small farms, an increase of the amount and variety of productions, and above all an increase of patriotism and of energy for the advancement of the common welfare. No longer are nearly one-half of its population enemies to the Commonwealth.

"Thus, I repeat, notwithstanding the lack of agricultural instruction, the wire-grass region with her negro labor produces more corn and cotton to-day than ever before. Her naval-stores industry and sawmills are almost entirely manipulated by negro labor, and the output of these is greater than ever in the history of the State. The only industry which I recall that was prosperous in antebellum times, but is behind now, is the cultivation of rice. This industry in Georgia has been greatly neglected. Before the war South Carolina and Georgia yielded 170,000,000 pounds of rice. Now the entire yield in the United States, covering North Carolina, South Carolina, Georgia, and Louisiana, is only 136,970,720, South Carolina and Georgia yielding only 26,638,720 pounds. This industry can and should be revived. The colored labor is the main dependence in the cultivation of rice. With the proper instruction and encouragement I see no reason why rice should not be as abundantly produced in Georgia to-day as before the war.

"The burden of this recital is a plea for the improvement of negro farm labor. It is suicidal to neglect the improvement of one-half of the farming population of Georgia, for more than 54 per cent of those engaged in farming in Georgia are negroes. To increase the efficiency of this labor by raising the standard of intelligent farming is to advance the best interest of the country. To instill into the negro farm laborer the ambition to become his own master on the farm is to awaken the ambition of the white tenant to become the owner of the soil he works and thus remove a great menace to the Commonwealth.

"The great drawback and discouragement of the colored farmers is a lack of working knowledge of the soil and of improved farming implements. I think I am safe in saying that there is now little or no effort put forth to improve the colored farmer. No farmers' institutes are held among them. Little or no agricultural literature reaches them. The agricultural experiment stations are of practically no benefit to them. Except those who are laborers upon farms of white planters, very few use the improved farming implements and machines. Both in field and barn the old methods of agriculture are still in vogue, especially among the colored farm owners. There are, however, some excellent exceptions to the rule.

"The credit system and general extortion are assigned as among the chief causes for a lack of improvement in the efficiency and bettered condition of negro farm labor. The lawlessness of lynchers and 'white cappers' is another prime cause for the abandonment of farm life by some. Their inability to make a living on the farm is another.

"It must be admitted, however, that these are not the only causes. General laziness and shiftlessness may be successfully charged against a large percentage of those who leave the farm and flock to the city. It must be admitted also that there is a growing class of white citizens in the country who are anxious to do all they can for the improvement of negro farmers, whether they are tenants or owners, and that it is largely through the efforts of this class that the colored people have accomplished what they have. A strenuous effort, however, should be put forth in the South to have the colored man become an intelligent owner rather than a wage worker or a tenant on the farm. The tenantry system tends to keep the farm laborer poor, ignorant, and lazy, and the cropper unambitious and unreliable. Ninety per cent of the farm labor of Georgia belongs to these two classes, and their general shiftlessness and restlessness are due to this system and to their ignorance. If given the same chance that would have to be given to imported foreign labor, and if a fair opportunity for education is given and the law officers are respectable, and the courts respected, the producing power of the negro can not be surpassed, and, too, I believe that the greater the number of land owners, whatever their nationality, the more

to 144,893 and the negroes to 166,710, or 21,817 more colored than whites. The colored people in this section had in 1890 added to their number more than 70,000 and the whites a little more than 56,000. The increase of population in this section has been quite great for the decade ending in 1900, but it seems that the colored people are still in the majority. According to the comptroller-general's last report for the year 1900 the wire-grass colored people own 413,178 acres of land, nearly half of the farming land accredited to the colored people of Georgia. All of them began to work for small wages or part of the crops. Now only about 30 per cent of them are crop-pers or wage-workers; 60 per cent of them are tenants or renters, and 10 per cent of them own and work their own farms. The wages for a farm laborer in this section are very small, and consequently there is a great temptation to leave the farm and work on the railroads, the turpentine farms, and the sawmills. This section is perhaps the greatest naval supply center in the world and the work is mostly done by the wire-grass colored people. While there are a number of vocations to which the colored laborer can resort for a scanty living, the average wire-grass colored man is a farmer. His farming, however, is of the crudest kind. Except in rare instances he has no practical knowledge of improved machinery. He follows the same routine of farm cultivation pursued by his late slave master, who himself had never introduced labor saving machinery into his farming.

"While it is a fact that as a rule the land which has fallen into their possession is the old broom sedge or so-called worn-out fields, yet since the war the acreage of improved land has increased in Georgia from 8,062,758 to 30,971,518 acres, and with it the value of farm land has increased. Their schools run from 3 to 5 months, and have been of immense value to the negro, for they are administered by one of the best State school commissioners in the country. Yet I do not think that they have had the greatest effect in rendering the labor more efficient and productive. The colored man has had no teaching along the lines of agriculture and horticulture, the needs of plants and plant growth, how to use fertilizers, how to make the common tools and agricultural implements, as well as

taking special control, so to speak, of the more intelligent farmers, and thus increasing the number of intelligent farmers, just as it is done by the experiment stations that are now in existence. They send out bulletins month after month.

Q. There is not much experiment about raising corn and cotton. That is a settled matter, is it not? It is well known how to raise both of those, is it not?—A. Well, it might be said to be so, sir, but I tell you there is a great deal to be learned about raising corn and cotton, about planting and the soil, and the experiments as to the kind of guano to be used. We are making advancement every year. Now, we are just beginning to raise long staple cotton, sea-island cotton, in various upland counties. We are discovering how to raise crops where we could not raise before.

Q. What I wanted to get at was this: Don't you think the trouble with your people is more the lack of continued perseverance, rather lack of knowledge as to how some of these crops are raised?—A. Well, you may take any class of people who are ignorant, and their ignorance is the cause of lack of perseverance. They do not persevere because they do not have any ambition and aspiration, and their ambition and aspiration are brought out by their knowledge—knowing that they can better their condition and how they can better their condition.

Q. Do you find that the younger generation of negroes who have had schooling advantages work harder and better and more successfully than the old class who were slaves?—A. Well, I meant to state in this paper that that is the fact. It is a fact that they do.

Q. You meant to say that?—A. Yes; I do. I have got the record—I have a number of records—here in my valise where I have taken the actual names in some nearly 30 counties of those who know. I myself, at the conclusion of the war in 1865, was 10 years old; the men who own property are about my age, as a rule.

Q. (By Mr. LITCHMAN.) What is the minimum limit of age of admission to your college?—A. Well, at 14.

Q. Fourteen?—A. Yes.

Q. Those admitted have a knowledge of rudimentary studies?—A. Yes; they are supposed to have, except in the very dense country districts, where we have to take them anyhow. They come there knowing practically nothing; but we do not take them from the city unless they have practically finished what is called the common-school branches or about the grammar-school course.

Q. Your first course of education is in the manual-training line?—A. Yes; manual training first, but not alone.

Q. You do not carry along the literary education with the manual training?—A. Yes; both at the same time. The manual training counts one, just as arithmetic counts one. They are supposed to go together.

Q. You set certain parts of the day of the week to certain branches?—A. A class passes to manual training and then to literary training; then the afternoon—the half day—is given to those who really go into the trades and do nothing else. When a boy has gone a certain distance in the literary course, then he has the privilege of choosing some one trade, and then he can devote the entire half day to that work until he has obtained a fair knowledge of his trade. We give him a little something—about 5 cents an hour—as an inducement for industry. We have 13 buildings on the ground now that have been erected just by that sort of work.

Q. Is any preparation made for the education in the higher branches, that they may be in their turn teachers among their own people?—A. No, sir; practically none by the State, except the Georgia State Industrial College. The fact of it is that we have got scarcely anybody in the country who is capable—very few colored men—of teaching the trades or agriculture.

Q. Would not education in the higher branches tend to develop a class of men educated sufficiently for the purpose of teaching?—A. Yes; it does that, a certain kind of teaching; but this class of teaching that will really help to apply their knowledge to industries, and especially to the soil, why, of course, we have very few teachers anywhere.

Q. The teachers among your colored schools are all colored teachers, are they?—A. Yes; all colored.

Q. Where do you get them from?—A. Well, from various sections; largely from the South; some of them from the North; some of them attended various Northern schools.

Q. Are they to any extent graduates of higher schools?—A. All of them; all in the higher branches are graduates of some school.

Q. You have no college preparation in Georgia for that purpose, have you?—A. Yes, sir; we have a number of missionary schools or colleges. I am of one of those schools, the American missionary school, and that school has been training mostly along the line of literature, giving a literary education.

Q. Do you think on the whole that the condition of the colored people in your section is improved from what it was 25 years ago?—A. Oh, decidedly.

Q. I want to find out how far you have observed as the result of that improve-

ment in the matter of thrift and saving among your people?—A. Oh, a decided improvement, sir; right along. If you will let me illustrate this point one way, about a mule, you will see how and through what difficulties this improvement has been made, and therefore be able to appreciate the savings of the colored people. I happened to know of a colored man who was buying a mule. They sold him the mule for, I think, \$50. He gave a note for and paid, I think, \$25 down on the mule. He was to pay the \$25 with interest at the end of the year. This poor fellow was unfortunate, and did not succeed in paying the \$25, so of course the mule went back to the owner; and he gave a new note, paying interest, of course. Somehow or other, strange to say, he failed again, and did not pay for that mule, and it was the third year before he made sufficient money to pay for that mule; but he paid for it.

Q. Under the first two attempts how much had he paid?—A. He had paid 10 per cent interest. On the whole business, now, he had paid \$37.50, and finally paid another \$5 in addition to the original amount for the mule, making a total for the mule of \$32.50. Now, that is perseverance.

Q. I was going to ask whether you were going to state that as evidence of perseverance of the colored people?—A. That is the way they have come into the possession of a large amount of this \$14,000,000 worth of property. These people have had a great desire to get hold of something—labor day after day. I began myself picking up rags on the streets of Atlanta in order to get an education, and continued to do it until I made money enough to go into school. Well, now, I am just one of hundreds who in a different way are striving to better their conditions. You can't imagine, sirs, the difficulty that the colored people have to be under in order to succeed, and when people say they are lazy they do not know the situation. I confess there are thousands of them who are lazy. Of course I stated that.

Q. (By Mr. TOMPKINS.) Professor, you speak of wanting a duplication of experiment stations.—A. Yes.

Q. For the colored people the same as the one now for white people?—A. Yes.

Q. Am I mistaken in the thought that that experiment station is for all the people, and not for the white people alone?—A. It is for all the people; you are correct, sir. But I thought I stated that there are conditions that it is unnecessary for me to go into. You gentlemen understand as well as I do—better, especially those of you from the South—understand it thoroughly, and I do not think I ought to say—

Q. Now, what I want to get at: If you suggest for the benefit of the colored people there ought to be experiment stations, is it your idea that the United States Government ought to establish them; that they ought to take a number of colored youths in there for the purpose of showing this specially on the grounds, conducting these experiments in their presence, instead of endeavoring to disseminate the knowledge to the people through pamphlets?—A. Partly, yes. I say partly yes and partly no. My idea is, now, for instance: I doubt if the average colored farmer could go into any experiment station and be attached to that experiment station and be competent to get the information that any youth could get that was in his secondary year's work of our school. I doubt if there is the same disposition to disseminate the information which might be obtained there among both classes; for, as you know, we in some sense are two peoples, and it is not very likely that any colored person will make any very strenuous effort, unless he is of some particular standing, to get such information from the white experiment station. I do not know that you get my idea.

Q. I want to find out wherein your impression was that the service could be improved; because in all the States the difficulty is to get the farmers to benefit themselves by the experiment-station work?—A. Yes.

Q. The only way it can be done is to write to the station to send information on this subject or the results of experiments from time to time?—A. Yes.

Q. Now, as I understand the conduct of experiment stations, if you should write now there would never be any inquiry made whether you were a white man or a colored man, a farmer or a merchant. They would send the bulletin.—A. That is correct.

Q. Therefore your proposition is that the information does not reach the kind of farmers you want it to. You want to suggest that the Government will do something that will reach them. Your proposition is that the Government shall establish experiment stations on a different plan from these, admitting 5 or 6 colored youths from each county and let them observe the experiments?—A. No, sir; that is not exactly the idea—that latter part. I would not have a change made. Now, there is one place that is something like it; in one or two States there are two experiment stations.

Q. Simply the experiment stations as they are?—A. Yes. We want them to cause incitement and encouragement among the colored people along the line of farming, and it would be, as it were, a sort of inspiration—headquarters, as it were, for the advancement of that class of interests. As a matter of fact, I think that when—I know a man in our State, as a man, one of the best farmers in the State, a man

deeply interested in farming. His efforts are put forth toward giving the farm labor information, and going to the people and hunting them up to go to the institutes, and having institutes; and there are no institutes among this other class.

Q. Well, do you think now that the establishment of experiment stations in connection with your school would be of special benefit to colored people?—A. Yes.

Q. Would it especially benefit them?—A. Oh, greatly.

Q. Better than the one now established for general services?—A. Decidedly.

Q. Better than several others established for general services?—A. Yes; in any State.

Q. You think the colored people feel that the experiment station is for the benefit of the white people?—A. That is the way they feel.

Q. Is not that part of the fault of education?—A. Of course it is.

Q. They could get that information if they tried? They could improve the situation?—A. Of course; yet I think it would be improper. Our schools are separate. We have separate schools. I happen to be at the head of a school that is for colored people, and there is another school, that branch is for white people. It is a separate thing right down.

Q. Do you think it would be better to have duplicate stations for the white people and duplicate stations for the colored people? That is, more than one for each?—A. One for each would be sufficient.

Q. One for each would be sufficient?—A. Of course I do not mean, gentlemen, and perhaps I ought not to say that. I simply mean what I have already said, and I think that is about it.

Q. (By Mr. KENNEY.) You spoke about the sentiment of the colored farmer in regard to experiment stations. Does the average colored farmer know there is such a thing?—A. The average colored farmer does not know anything about it.

Q. (By Mr. LITCHMAN.) Has any attempt been made to hold institutes to which the colored people have been invited?—A. Not that I know of; I never heard of any.

Q. Your idea is that if there were an experiment station manned by colored people there would be an attempt to bring in colored people?—A. Yes; it would be the object of the man who was at the head of that institution to see to it that it was done; it would be his business to do it.

Q. There are institutes now held in Georgia?—A. For white people, yes. I think the average white farmer in Georgia is as intelligent as the average white farmer anywhere, but the colored farmers—there is nothing to it, except those fellows who just come right up and by main force get hold of some soil and make this improvement in the manner I told you about—that mule. That is the way they get it exactly; yes, sir.

Q. (By Mr. TOMPKINS.) Don't the colored people sometimes attend the farmers' institutes that are now held?—A. I never heard of any.

Q. Have any been excluded from one?—A. I could not say that, but you ought to be able to answer that question yourself, if you will pardon me.

Q. I am in the same fix you are—I do not know; I never saw one apply.—A. You know the premises and you can draw the conclusion.

Q. The farmers' institutes before have been very successful. It is improving all the time; but this is entirely a new phase of the question, as to colored persons wanting to attend at all?—A. That is it. They do not know. Ignorance has been the thing. I am after removing the ignorance.

Q. I wondered if anyone ever had thought of wishing to attend and made any effort in that direction?—A. Yes, sir. Well, now, that is just the point. Now, I have written and I have letters from—I may say that I think I am on as good terms with the white people of Georgia as any other colored man, and I get just whatever information as a rule I write for, and I have written on this question to nearly all the prominent white men interested in this subject in Georgia, and I have their letters, and for 25 years I think that I have always stood all right with them. They think that I have been at the head of State or city schools during the entire time I have been in Georgia—I have never been out of a position, never have had my speech curtailed, as it were. I have always said what I thought was right, and have had no trouble, so you see nothing I may say would give any indication of the fact that I am at all disgruntled, but I am simply getting at the fact, the benefit of all the people.

Q. Has the State of Georgia any other State institution except this one?—A. None there for colored people; quite a number for whites, not any other for colored.

Q. I was wondering whether under the United States laws and the State laws it would be possible to divide the experiment-station fund for two stations, say one at this university and one somewhere else?—A. The other thought, if you will pardon me, has reference to the giving of an opportunity for colored youth to secure scientific agricultural information at the Agricultural Department at Washington. I think, under the law, the Secretary is allowed to take into the national Department

certain men for instruction. Now, it seems to me that if that could be done—taking a few in from the various places and from such colored schools as they might be selected from—bringing those men here and training them and then sending them back to the South—making, as it were, a contract with them that they shall go back there and devote a certain amount of their time to this class of work in some way—it seems to me that farm labor might thus be improved and the conditions greatly improved.

Q. (By Mr. TOMPKINS.) Have you suggested that to the Secretary of Agriculture?—A. No, sir; I have not. I have put it in this testimony here as the thing that occurred to me as being something of a remedy for the condition.

Q. (By Mr. LITCHMAN.) Have you any opinion to give upon the effect upon the negro of a partial disfranchisement, his present condition, and his future prospects?—A. Well, I have referred to that in this way: Of course, individually I think it is a great mistake at this late day, unless it were to act only in the future. A qualification that deprives anybody of the ballot which he now possesses should be delicately considered, but a qualification meant as a help—but as a help—I do not know as it does any harm. I do not see any special good, however, that such restriction as contemplated does.

Q. Do you think it is an objection that the men should be compelled to read and write in order to have the right of suffrage?—A. Not at all.

Q. Do you think that the ultimate good to the voter in a sense justifies a restriction of that kind?—A. To the voter?

Q. (By Mr. PHILLIPS.) White or black?—A. I should think so.

Q. (By Mr. LITCHMAN.) It is undoubtedly a benefit to the State that a voter should know the ballot he was voting?—A. Yes; I see no objection to an educational qualification.

Q. Has there been any influence upon labor itself by divorcing it from politics and compelling it to pay attention exclusively to labor?—A. Well, that is a very far-reaching question. I do not know that I can answer that.

Q. (By Mr. A. L. HARRIS.) Where is your experiment station located?—A. Griffin, Ga., in the central part of the State.

Q. Has any suggestion ever been made to establish a branch or branches?—A. No, sir; not that I know of. I do not know that there has.

Q. Would it not be well to ask that a branch be established at your place, or wherever it is thought best?—A. Yes; perhaps that could be done—I have never asked. Branches are established in other States; saying nothing, of course, about color.

Q. Now, does the farmer who rents on shares—is he in any way handicapped by any law in your State in regard to crop liens or anything of that kind?—A. Well, I do not think I know very much about that; no, sir.

Q. You have not had any experience?—A. No, sir; have had no experience.

Q. (By Mr. FARQUHAR.) Your expressions about the experiment station would lead the commission, I think, to conclude that you would like to have an experiment station that would be a school?—A. To be a school?

Q. Yes.—A. No, not exactly; no, sir. I do not mean to give that impression. My idea is that at an experiment station experiments are made with reference to various classes of crops, bulletins are sent out, but an experiment station is open and free; that anybody is at liberty to go there and watch and see experiments and find out about it. For instance, the placing of certain kinds of manure or guano upon the plot of ground and planting something upon it. Now, if one could go there and see how that is, getting that information, and seeing it—see the experiments made, as it were, get some information from the director of that experiment station as he is able to give, and in that way this man goes away improved, and he carries that information back. I do not mean it shall be a school. I do not mean at all that its business shall be the mere book instructing of people; it can not do that; it would not be for that purpose. It is simply making experiments and giving the results, or having places where experiments are made and one may go there and thus see the experiments carried out and get such information as the experiment station is able to give him, and carry it back to use on his farm.

Q. (By Mr. FARQUHAR.) To go back to this experiment station matter. At Griffin you can have 150 bulletins that will explain every grade of soil and every appliance of chemistry to production?—A. That is exactly right.

Q. Now, you have to have an intelligent person to read these bulletins?—A. T at is right.

Q. You have a population that is not intelligent enough to read them?—A. We have such a population—a great many of them, that is true, but then at the same time, if you will pardon me, at the same time we have also many that can read and would be interested in such bulletins and yet it is not merely the bulletin. You can go to Washington and get a bulletin, and there in your own State—the experiment

station, in my judgment, at Griffin to-day is one of the greatest inducements or encouragements to the various farmers, and is becoming year by year more so; it is doing a great service; now its service is done simply to one class of people.

Q. Well, what is done for the whites is open for the blacks?—A. Well, now, if you can make that statement I will not attempt to controvert it.

Q. Is not the difficulty the poverty and their lack of intelligence in reaching these stations among your people; that is the argument in the concrete?—A. That they are ignorant?

Q. That they are ignorant. Now, could not you remedy that through a class of institutes instead of experiment stations where you come in contact by comparison with all other cultivators—where you have your experiment station up there they make addresses and enlarge on the chemistry of the soils; they talk about diversification of crops and changes of crops, and also give an indication of bookkeeping and frugality of farming?—A. That seems to me to be the result. As I look at it, in a large measure the thing I am striving for is not that the experiment station will directly and immediately reach the large masses, but that it will reach the most intelligent, and that these institutes of which you speak will be this—that shall be the result from this thing, rather than with the institutes themselves. The institutes do not come except there are certain men who are interested in that business, and being interested in that, then institutes follow as a consequence. Now, as a matter of fact, of course you take the experiment stations in any State—I think it is true in ours, that the men who are interested in that—take the commissioner of agriculture and take the director of the experiment station, as well as others, but those especially are the men who are in charge of these stations. I have seen again and again the reports all over the State—the director going in to interest the people and observe—I notice there was a record of the acreage of cotton, and the director of that station has gone almost all over the State for the purpose of getting such information, but it is to the white planters—the white farmers—he goes, and for the very reason you have just spoken of. Now, the idea is to reach the most advanced of the negro race, those who have education, and to permit them to go there and see the experiment done, and thus be trained for that work.

Q. (By Mr. PHILLIPS.) I believe you said there were about 500 students in this industrial college?—A. Yes.

Q. About how many teachers have you?—A. We have only 17.

Q. Do you consider that a sufficient number?—A. No; we have not enough, but we are using all the money we have got.

Q. Well, how many colored people are there in the State of Georgia?—A. Well, 800,000—a little more than that.

Q. How many white people are there in the State?—A. A little bit more; I do not remember the figures—something over 2,000,000 of both races in the State, but there are about—the percentage is something like this—about 46 to 54.

Q. 46 to 54?—A. About 47 to 53.

Q. Now, you spoke of the amount of taxes that the colored people pay?—A. Yes.

Q. What proportion do they pay?—A. Oh, very little.

Q. And yet you state they paid 14,000,000 one year?—A. That they own 14,000,000 of property.

Q. And the amount of tax?—A. The amount of tax I did not state. I simply mentioned one section—a group of counties in which they pay more taxes than they seem to get benefit of either for purposes of education or police protection. As to the State, of course, taking in the cities and all that, their payment of taxes is a mere bagatelle.

Q. Now, you spoke also of the wire-grass section?—A. Yes.

Q. Is that peculiar to the State of Georgia or does that grass grow in other States along that line?—A. I do not know. I know it is in Georgia and grows only in that section of Georgia.

Q. We would infer that the soil was good where this wire grass grows?—A. It is; yes.

Q. Is the wire grass utilized? Do they use it for pasture?—A. No; really it has been useless, so to speak, until lately. It has not been used very much. Some people use it for making baskets and some for mattresses and such things as that, but not for hay. The hay grass is another class of grass.

Q. Will that soil produce hay?—A. Oh, yes; oh, yes.

Q. Produce good pasturage?—A. Yes; and as I gave an account of the live stock.

Q. After the other is turned down?—A. Oh, yes; oh, yes.

Q. Produce good pasturage?—A. Yes; and as I gave an account of the live stock there, it is very fine, and the live stock among the white people has increased very largely, indeed, and somewhat among the colored people.

Q. Where the colored population is quite dense, is there a tendency for the white population to get back from it, or decrease or what is it?—A. I understand from the figures I gave you a while ago—I do not know, but in that region in 1870 there

were more white people than colored people, and in 1890 there were more colored people than white comparatively. As to 1900, I do not know. The increase for the entire section of both races has been 36 per cent. Now, whether the increase of the colored people is greater than that of the whites, I do not know, but that seems to be a fact, although I do not know it to be a fact.

Q. The colored people increase more rapidly where they predominate?—A. It seems so. I would not state it as a fact, but it seems to be a fact just in that particular section, anyhow.

Q. (By Mr. KENNEDY.) I want to ask a question or two about the disfranchisement of the colored men in some of the Southern States and its effect if they are disqualified, and it will be necessary for them to have an educational qualification before they will secure the ballot. Will that, in your opinion, be a good thing for the colored race, in that it will stimulate them to acquire this necessary knowledge?—A. I think it will; yes. I think it will, although in our State there has been passed no disfranchising enactment, and I am rather proud of the fact that the State has not done so; but yet I am under the impression that a qualified ballot will stimulate the acquirement of the necessary knowledge.

Q. That that will be the effect?—A. That that will be the effect; yes.

Q. Are there large numbers of colored people in Georgia who take no interest in politics and do not vote under present conditions?—A. Oh, yes; very few colored people take any interest in politics.

Q. Is it probable that if they were disfranchised—if they should have to qualify themselves in an educational way—that they would take more interest?—A. Well, the benefit that I have in mind—the only thing—the fact that they are forced to qualify themselves before they can vote may be to arouse them to vote; but the colored people, because of certain conditions, have very largely come to the conclusion, except in cities, that it is none of their business anyhow; they do not bother with it; they let the thing go. Well, I do not know. Of course some ignorant people—some demagogue comes along, you know, and the first thing you know arouses all that class to some spasmodic thing. So the expectation is that they will get roused, if they could be aroused to vote by this restriction, they would at the same time be qualified and be better prepared to vote upon the issues that are presented, understanding them better than they can now possibly understand them. I do not know how that would be, but still that is just an idea of mine; I am not sure. I am sure, though, that an educational qualification would be the best thing.

Q. (By Mr. FAUQUIER.) I would like to ask you (you mentioned in your paper several drawbacks there to the advancement of the colored man), have you had experience enough and observed enough to know what the social habit of the colored race was so far as temperance was concerned?—A. Was before the war?

Q. No; any time, now or before?—A. As to the social habits?

Q. Yes, as to temperance.—A. As to drink habits?

Q. As to temperance habits alone. You have mentioned various drawbacks, now let us get at it practically.—A. Now, I am satisfied of course that they drink too much whisky; I am satisfied of that.

Q. How much of their substance do you think they consume in liquor?—A. Well, poor people, as you know, consume more if they can get at it, than any other class of people. That is what they do, and of course these people are poor and without ambition; and very often, because of their poverty, I think they do consume quite an amount of their substance. I would not give you any percentage, but I know that they do, because, of course, I am working among them.

Q. Do you not really think that that is the most serious drawback that you have with the colored race in the South?—A. No; I do not.

Q. I mean in their acquiring property or improving their position?—A. I think it is the result; it is not the cause. I think the other thing is the first, and I think if you remove the first thing that it would greatly relieve this matter of drinking. Of course, the disease and death in various districts show that we die very rapidly from various diseases, from consumption and pneumonia; but the consumption and pneumonia are brought about by the very thing I have just mentioned. It is ignorance; lack of get-up. It is a hard thing to better ones condition, I tell you, when you are on the bottom. It is a hard thing to rise to a higher standard of living, which brings a higher life—a hard thing.

Q. Is there any attempt made in the South through your churches or otherwise to suppress this intemperance?—A. Yes; our preachers preach against it and our teachers teach against it.

Q. Have you any societies?—A. Oh, yes; any number of them. I belong to a society that I joined when I was 13 years old, and I have been a member of it ever since—a temperance society.

Q. Have you noticed whether the rising generation are subject as much as the passing generation—the young people?—A. The old generation, you know, could not get at it as well. I remember my uncle used to bring his jug home Saturday

night, and now and then they used to get hold of the jug; but, of course, they can get at it now—a few dimes, you know, and that is all. They spend their money to get a drink, and that is the way around town.

Q. (By Mr. PHILLIPS.) Now, Professor, you said some time ago in your testimony that you thought it would be very advantageous and very beneficial, in fact, if there were an appropriation made by the Government for educational purposes in the South.—A. Yes.

Q. You believe that to be a fact?—A. I certainly do; yes.

Q. Well, as a race, have you made any effort along that line?—A. Yes.

Q. To get such an appropriation and bring influence to bear on your Congressmen or on the United States Senate or the people?—A. Yes; we have. Not lately, but some time ago there was quite an effort made. There were meetings held, and attention was called to it. In fact, we did get some of the Representatives to take an interest in it, especially when the educational bill was before Congress.

Q. That was the Blair bill?—A. The Blair bill. When the Blair bill was before Congress both times we held meetings, and I remember that the gentleman, who was afterwards Senator Walsh, of our State—I got him to go and make a speech, and he did make a speech, and I think really that our legislature joined in with the sentiment. I am not sure but that they also expressed to Congress their approval of such a movement.

Q. And you would recommend that?—A. Yes; I certainly would.

Q. Have you any other remedial legislation to suggest to this commission for the benefit of the colored race?—A. I do not see, if they can get the means for education—it seems to me that is all they need, and it is all anybody needs—if they can get a chance, the State is not able to give it to you.

Q. In your paper you said if the Government had given the colored people 40 acres of land instead of the ballot it would have been more beneficial?—A. Yes.

Q. Now, would that have been possible at that time? Would the Government have had the land to dispose of?—A. Yes.

Q. Would it have been a possibility?—A. I think it would have been a possibility, but whether it would have been in our State or not I do not know. Of course, the Government has an immense amount of land.

Q. Not in your State?—A. No; not in our State. We have no public land in our State. But the Government has in other States; it has in Alabama, in Mississippi, in Louisiana, and in Arkansas; and in quite a number of States it has public land. Now, that, of course, was a mere statement along this line that I made at that time.

Q. Would it not be possible now for the Government to give that land?—A. No; not at all. At that time it seems to me that they were more in need of being tied to the soil in some sort of way than they were of getting the ballot.

Q. Then the two recommendations you would make would be for additional experiment stations and for education?—A. Three.

Q. Three?—A. Three. One of them would be for the duplication of experiment stations; the next would be national aid to education; but the most practical, it seems to me, would be that the Secretary of Agriculture should be willing to select some colored youths, 5 or 6 colored youths, from the various States, as he is doing now, and have them get the training that they can get there so that they might go back to the South and engage in that class of work themselves.

Q. Have you anything to add, Professor, to your testimony that we have not covered, that you think would be of importance to the commission?—A. No; I do not recall anything.

(Testimony closed.)

WASHINGTON, D. C., June 14, 1901.

TESTIMONY OF PROF. ISAAC P. ROBERTS,

Director of the College of Agriculture in Cornell University, Ithaca, N. Y.

The commission met at 10.45 a. m., Vice-Chairman Phillips presiding. At that time Prof. Isaac P. Roberts, of Ithaca, N. Y., appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) Please state your name, your address, and your profession or occupation.—A. Isaac P. Roberts; Ithaca, N. Y.; director of the College of Agriculture and dean of the faculty of agriculture in Cornell University.

Q. How long have you occupied that position?—A. The latter position, dean of the faculty, since 1874; the directorship since about 1880.

Q. What was your occupation previous to your present occupation?—A. I was professor of agriculture in the Iowa Agricultural College at Ames for nearly 4 years. Previous to that I followed farming.

Q. The commission would like to hear, in the first place, how the land scrip donated to New York State was sold or disposed of?—A. About 990,000 acres of land scrip were given to the State of New York, but New York could not own land in another State, and there being no public lands in this State Mr. Ezra Cornell agreed to purchase all of the scrip at 60 cents an acre, to pay 30 cents an acre cash to the State, to locate the lands, to pay taxes, manage them, and when the lands were sold to pay into the State treasury 30 cents an acre more. He also agreed to pay into the university treasury all profits from the sale of these lands, which profits amount to more than \$4,000,000, with 140,000 acres of land yet to be sold. He also agreed to give an endowment of \$500,000 provided the State would give the entire land grant to one institution instead of dividing it, and to make a further gift of a farm of more than 200 acres if they would locate such institution at Ithaca, N. Y. Mr. Cornell located these lands largely in the pine districts of the Western States, and in 1874 he deeded all the lands to Cornell University. There has been realized on these lands up to August, 1900, \$4,292,628 over and above all expenses of carrying, and after payment into the State treasury of the 60 cents an acre for the scrip. In addition to the Ezra Cornell endowment fund, other wealthy men have given liberally endowments and buildings, until at the present time the university has an income fund of nearly \$7,000,000, and buildings and equipments valued at more than \$4,000,000.

Q. Then the entire university is, in a sense, an outgrowth of the land grant?—A. The land grant and private benefactions.

Q. You may state, if you please, as fully as you desire, the educational work of Cornell University along the line of agriculture.—A. There was an attempt made to teach agriculture at Cornell before I went there—not very successful, however, possibly largely because there were too few students to make a college. When I went there there were 3 students entered in the College of Agriculture, and there were about 3 of us of the faculty, and it constituted the teaching force, exclusive of those who taught pure science. The college did not grow rapidly, by reason of prejudice, and by reason of lack of funds to develop it, till about 1882 or 1883. About that time we endeavored to reach the farmers through farmers' institutes. I can not give the exact date, but the first one in the State was held at Cornell University. Later this resulted in the State appointing a commissioner of dairy husbandry, and it was soon found that dairy husbandry had to do with all branches of agriculture, so the office was expanded later into that of State commissioner of agriculture. All of the institute work was placed under the commissioner's control. Previous to that I had had much to do with the institutes. The commissioner appoints a director who selects from 10 to 15 experts. This force is divided into 3 or 4 groups. By this method they are enabled to hold from 300 to 400 institutes and to reach nearly every village and hamlet of the State some time during the winter.

Q. Do you encourage local talent in the institute work?—A. I think they always try to get one local speaker at the place where the institute is held. The corps of instructors in the College of Agriculture helps so far as it is able to do so.

Q. Have you a State fund that helps to defray the expenses of institute work?—A. Yes; there is an annual appropriation of \$10,000 for carrying on this work.

Q. You may state, if you please, in a general way whether the institute work is in a healthy condition and whether it is considered beneficial to the agriculturists.—A. I should say it was in a very healthy condition, and that the farmers appreciate the work is proven because the demand for the institutes is greater than can be met.

Q. What courses in agriculture are given at Cornell?—A. The university provides for a 4 years' course which leads to the degree of bachelor of science in agriculture (B. S. A.). It was found that there were comparatively few students who desired his long and severe course. A special course of 1 or 2 years was opened to meet the wants of those who did not wish to take the full course. The student can enter upon this course without a formal examination. The director decides from documents filed with him whether the student is fitted for the course and can pursue the work profitably. He must be 18 years of age, and two-thirds of his work in the college must be directly related to agriculture. He can stay 1 or 2 years, not more than 2, as he would by that time exhaust all the purely agricultural subjects.

At the present time there are just about as many 2-year, or special students, as there are 4-year men.

Later, we opened a winter course of 11 weeks. About one-half of the students elect to take dairying, pure and simple. The students who elect general agriculture pay little or no attention to learning the art of manufacturing butter and cheese, but 50 students can be accommodated in the dairy building. Usually there are 60 or 70 applicants for this course. Nearly all of the students in the winter course are farmers' sons. But few girls enter this course.

Facilities are also provided for pursuing post graduate work in agriculture. Our own students and students from other colleges come to us to carry on their research

work for 1 year or more. When the work is satisfactorily performed they are given the degree of master of science in agriculture (M. S. A.). There are 17 students in the college at the present time who are taking both their major and minor subjects or their major subject in agriculture. This is most gratifying, since it indicates that students in agriculture are willing to spend time enough to fit themselves in a superior manner for teachers, experimenters, and directors of large undertakings. Since last September the College of Agriculture has placed 56 of its students in lucrative and honorable positions, which indicates that there is a demand for trained men.

Q. (By Mr. FARQUHAR.) You say you divide into 2 groups, general agriculture and dairying?—A. Yes; in the winter school of 11 weeks.

Q. Now, in teaching either the general agriculture or the dairying, is it optional for your students to go into, for instance, geology classes, or botany, or chemistry, or other general work there? Are they really attendants at this as well as in your own college, or do you teach those subjects in relation to agriculture?—A. No; there are special classes formed for the winter-course students in chemistry, entomology, veterinary science, and kindred subjects. The principal part of the work, however, is given by the college of agriculture. No tuition is charged for any of the courses in the college of agriculture. The winter-course students are required to take at least two-thirds of their work in subjects related directly to agriculture.

Q. Practically, then, the student's whole time is in the college of agriculture?—A. Yes.

Q. Is your curriculum wide enough in scientific agriculture to take in everything that the finest schools of that character do?—A. Yes; the 4-year course is. The requirements for entrance to the College of Agriculture are just as high and just as severe as those for the College of Arts and Sciences; 2 years of French, 2 of German and the higher mathematics are required for entrance. The work of the first and second years is designed to give a liberal education; that of the third and fourth years is devoted to the practical application of the sciences and knowledge to agricultural pursuits.

I may make it broader. In the last years of the 4-year course the effort is made to fit the student for practical life, especially along the lines of rural pursuits, and in all the aim is to give *"a liberal and practical education to the industrial classes in the various pursuits and professions of life."*

Q. (By Mr. A. L. HARRIS.) What per cent of your graduates return to the farm and engage in practical farming?—A. Of 394 former students and graduates heard from recently, 87 per cent; of the graduates alone, 85 per cent; of the winter-course students, 95 per cent; of the special students, 66 per cent. We have not been able to hear from all of our graduates.

Q. (By Mr. WEST.) Does that include those engaged in teaching?—A. Yes.

Q. (By Mr. FARQUHAR.) Have you any statistical information as to the number of your graduates?—A. From 1868 to 1900 there were 114 post graduates, 123 graduates, 368 special students, 544 winter-course students, and 200 summer-course students in nature study. During the last year, 1900-1901, there have been 17 post graduates, 49 regular-course students, 14 of whom will graduate at this commencement; 50 specials, and 95 winter-course students.

The work of the college is divided into three rather distinct lines—one is teaching at the university; the second is experimenting and investigating both at the university and among the farmers of the State; and the third is university extension in agriculture, this being an effort to promote agricultural knowledge throughout the State, especially among the industrial classes.

Q. (By Mr. A. L. HARRIS.) Please describe your experiment-station work.—A. Under the Federal law we received \$15,000 for carrying on investigations. Some 5 years since the State appropriated \$1,500 of this to the State experiment station, located at Geneva. The \$13,500 is used to conduct investigations at the university, to publish bulletins, and to furnish experts, when called upon, throughout the State to investigate any serious outbreak of insect pests or diseases of animals or plants. About 12 bulletins are published yearly, together with an annual report.

Q. Are they distributed free?—A. Yes; we have the franking privilege, the same as other experiment stations. Our mailing list runs from 20,000 to 30,000.

Q. How is your mailing list made up?—A. By request for bulletins from the farmers. About once a year we slip cards into the bulletins and ask that they be returned in order that we may determine whether the parties receiving the bulletins are interested enough in them to open the publication, at least, which, if they do, they will find the card. In this way we cut off the careless and the laggards and eliminate from our mailing list those who are not interested enough in our publications to read them. If the cards are never returned the name is dropped from the mailing list.

Q. Do these bulletins cover the questions of investigations of all branches of agriculture?—A. Yes. Formerly the investigations were largely conducted along general agricultural lines. Since receiving the State appropriation we have paid

much attention to horticulture and the diseases of plants, and to dairy husbandry. Horticulture and dairy husbandry are the 2 leading agricultural industries in the State.

Q. Do you investigate the removal of insect pests and other causes of detriment to the farmer?—A. Yes; the work of investigation is divided into the bureaus of general agriculture, horticulture, dairy husbandry, entomology, and chemistry. At the head of each of these bureaus is a professor to manage it under the director. Each bureau has a man available to send to the relief of the farmer. If, for instance, there is an outbreak of any noxious insect, within 12 hours a man is started to the place where the trouble occurs, to make an investigation. So in like manner with horticulture. Plants are affected; a man is sent immediately to investigate the trouble. In addition to all this, the director's office is a sort of clearing bureau, where all sorts of questions come. These are all answered, amounting in some instances to 100 per day. The questions are sorted and distributed to the various bureaus. Often a short letter and a bulletin will suffice, a similar case having been investigated before, but the questioner has not seen the bulletin. This gives a general idea of the way the work is carried on.

Q. Do you experiment upon different kinds of seeds, depths of planting, and cultivation?—A. Not much with different kinds of seed, because whether varieties do well or ill depends largely upon locality. Experiments at the university with varieties are not extensive. Our experiments in cultivation and tillage are numerous. We are trying to induce the farmers to experiment for themselves—helping him to help himself. In 1900 there were enrolled 189 experimenters with sugar beets, field beans, potatoes, and fertilizers. Some of these were men who became interested in growing beets because of the erection of sugar-beet factories at Birmingham and Lyons. Before the factories were completed we were in the field trying to help the farmer master this new industry. The teachers travel largely on bicycles from farm to farm. Each experimenter may have 5 or more plots with different varieties or with different tillage or different kinds of fertilizers. We send out to these experimenters small quantities of fertilizers; for instance, a sack of dissolved rock, one of muriate of potash, and one of sulphate of ammonia. Each sack may contain from 15 to 30 pounds. The farmer now begins to experiment by putting these various fertilizers on measured areas in different combinations in order to determine whether the soil is deficient in one, two, or all of these plant foods. We send a field agent, so far as possible, to see that the work is properly done.

Q. Is there such a thing as determining the amount of plant food in the soil in the laboratory?—A. Yes; you can very easily determine the amount of plant food, but no method has been discovered by which the chemist can tell what proportion of the plant food is available, since availability depends on several factors, such as heat and moisture, and many others.

Q. Field experiments, then, are better than laboratory in that respect?—A. They should go on simultaneously. For instance, the chemist finds a soil that is rich in potash. The farmer applies potash and finds that it improves his crop. We now know that the potash is not readily available. The question now naturally arises whether it is best to apply more potash or try to energize the lazy potash which is in the soil by the application of gypsum, for instance, or by increased and superior tillage; so we in like manner test the various plant foods in both soil and laboratory, and we also try to discover what varieties of plants will feed upon tough plant food and what ones require their food prepared so that it will be in an easily available form.

Q. Is it possible in cropping to remove plant food from the soil so that it will not produce, while a soil of similar character in the same neighborhood will produce quite a crop?—A. Yes; and not only that, it is possible to so till land as to lock up the plant food; and while the farmer has not robbed the land of its plant food, by injudicious tillage and for lack of tillage the plant food has become tough—more or less unavailable.

Q. If all the plant food in the soil were available, in a short time what would be the result?—A. Oh, a desert. Nature is very conservative. If there is not a plant to use the food when it is available, nature locks it up in most cases, and saves it for the man who has more sense than to leave the land bare—that is, uncovered with crops for any considerable time. In the case of nitrogen, that does not always hold true.

Q. Then, it is not absolutely necessary for a farmer, in order to determine the plant food in the soil, to have it analyzed in the laboratory, but by experiment he can become acquainted with the plant food that each plant requires, and he can soon tell which plant food is adapted to it?—A. The plant, to an intelligent man, always tells him more than the chemist can, but none the less we can not do without the chemist, as he may solve many questions which the farmer can not, and assist in solving those which require both the farmer and the chemist.

Q. You know the material you have in hand and you can give it in the order that you think will present it in the most intelligent and practical way?—A. The work of investigation and experimenting may all be summed up briefly by saying that while we are experimenting at the university we are also doing our utmost to get the farmer to investigate for himself. We have emphasized the better tillage of the land perhaps more than any other one subject, and we are pleased to note most marked beneficial effects resulting from these experiments and from the emphasis which we lay upon the subject in our publications. In fact, we have been preaching the gospel of "hot plowshares."

Perhaps I have gone into sufficient details outlining our experimental work, and I will now proceed to the university extension work in agriculture. Some 8 years ago the people in the western part of the State, where they are much interested in fruit growing, asked for a speaker to come to their aid. We sent a lecturer who gave such good satisfaction that they asked for other speakers. But it was found that the instructors at the college could not meet the demand made upon them and carry on their own work at the university. To do this work, more men and money were needed. The farmers of this locality secured an appropriation of \$8,000 for the purpose of carrying on investigations in horticulture in the western part of the State. The next year they succeeded in having the appropriation doubled and the territory and work enlarged. The following year they succeeded in having the law changed so that the \$25,000 which they secured could be used "for the promotion of agriculture throughout the State." Before, the work had all been done in horticulture. During the last 2 years the farmers have secured an annual State appropriation of \$35,000 "for the promotion of agricultural knowledge throughout the State."

Q. There is a disposition on the part of your legislature to meet the needs of the farmers by appropriations?—A. Yes; I think so. We started out in the early years by holding schools of agriculture and horticulture on the farms or at the little hamlets in the farming districts. By this means we found we were not reaching any large number, and the idea was conceived of teaching the teachers of the public schools. We sent lecturers to the teachers' institutes who got places on the programme from day to day. The work was not altogether satisfactory at first because of the time limit. About this time we commenced to send out literature—leaflets of construction, nature-study leaflets, and similar publications. Still later a summer school of 6 weeks for teachers was organized at the university. The subjects taught were nature study in insect life, in plant life, and on the farm. This summer school was continued for 2 years and had a total attendance of 200 pupils. These teachers who came to us were largely from the cities, and while the summer school was eminently successful we believed we were not reaching the farmer and his children as directly as we should. The school was discontinued and leaflets and other publications were substituted, in a measure, for it.

It was soon found that the publications must be quite varied to meet the wants of our varied constituents. A farmers' reading course was established in 1898. During that year 8,563 farmers joined the course; in 1899, 9,229, and in 1900, 4,700, making a total of 22,492. We also have organized farmers' reading clubs, which are composed of 10 to 12 young farmers, usually meeting in the evening or afternoon at the residence of some club member. There are 48 of these clubs, with a total membership of about 1,000. The farmers' wives called our attention to the fact that there were no publications adapted to their wants. To meet this demand a farmers wives' reading course was organized, which has a membership of 4,747. This course has been organized but 1 year. The school teachers made a similar request for help along the line of nature study. Leaflet No. 1 and others have been issued to meet this demand. There are 11,500 teachers receiving teachers' leaflets from time to time. This copy of leaflet No. 1 will give a fair idea of the kind of literature which is being furnished to the teachers:

TEACHERS' LEAFLETS ON NATURE STUDY.

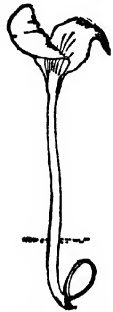

[Teachers' leaflets for use in the public schools, prepared by the college of agriculture, Cornell University, Ithaca, N. Y. Issued under chapter 128 of the laws of 1897. Eighth edition. Issued under chapter 67, laws of 1898. No. 1. April 10, 1898.]

[NOTE.—These leaflets are intended for the teacher, not for the scholars. It is their purpose to suggest the method which a teacher may pursue in instructing children at odd times in nature study. The teacher should show the children the objects themselves—should plant the seeds, raise the plants, collect the insects, etc.; or, better, he should interest the children to collect the objects. Advanced pupils, however, may be given the leaflets and asked to perform the experiments or make the observations which are suggested. The scholars themselves should be taught to do the work and to arrive at independent conclusions. Teachers who desire to inform themselves more fully upon the motives of this nature-study teaching should write for a copy of Bulletin 122 of the Cornell Experiment Station, Ithaca, N. Y.]

HOW A SQUASH PLANT GETS OUT OF THE SEED.—BY L. H. BAILEY.

If one were to plant seeds of a Hubbard or Boston Marrow squash in loose, warm earth in a pan or box, and were then to leave the parcel for a week or 10 days, he would find, upon his return, a colony of plants like that shown in fig. 1. If he had not planted the seeds himself or had not seen such plants before, he would not believe that these curious plants would ever grow into squash vines, so different are they from the vines which we know in the garden. This, itself, is a most curious fact—this wonderful difference between the first and the later stages of all plants, and it is only because we know it so well that we do not wonder at it.

It may happen, however—as it did in a pan of seed which I sowed a few days ago—that one or two of the plants may look like that shown in fig. 2. Here the seed seems to have come up on top of the plant, and one is reminded of the curious way

1. Squash plant a week old.

2. Squash plant which has brought the seed coats out of the ground.

in which beans come up on the stalk of the young plant. If we were to study the matter, however—as we may do at a future time—we should find a great difference in the ways in which the squashes and the beans raise their seeds out of the ground. It is not our purpose to compare the squash and the bean at this time, but we are curious to know why one of these squash plants brings its seed up out of the ground.

3. Germination just beginning.

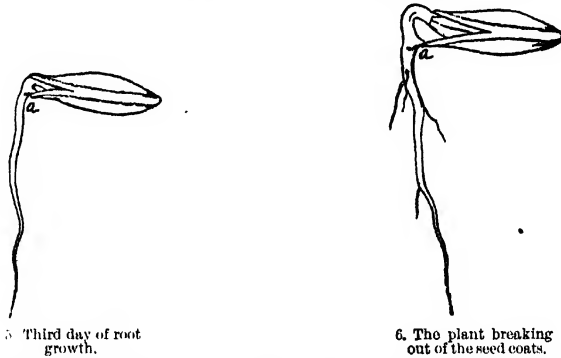

while all the others do not. In order to find out why it is, we must ask the plant, and this asking is what we call an experiment. We may first pull up the two plants. The first one (fig. 1) will be seen to have the seed coats still attached to the very lowest part of the stalk below the soil, but the other plant has no seed at that point. We will now plant more seeds, a dozen or more of them, so that we shall have

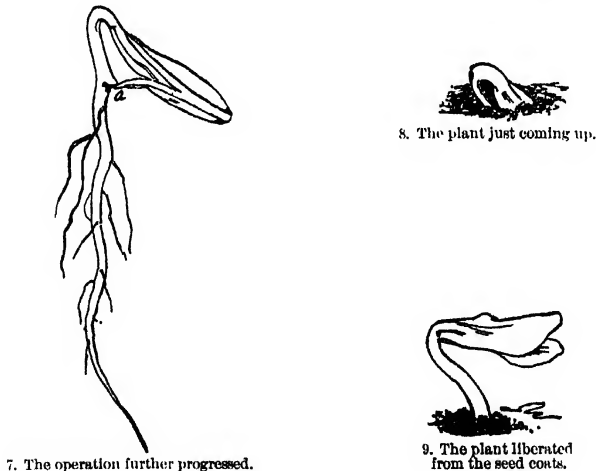

4. The root and peg.

enough to examine two or three times a day for several days. A day or two after the seeds are planted, we shall find a little point or root-like portion breaking out of the sharp end of the seed, as shown in fig. 3. A day later this root portion has grown to be as long as the seed itself (fig. 4), and it has turned directly downwards into the soil. But there is another most curious thing about this germinating seed. Just where the root is breaking out of the seed (shown at *a* in fig. 4), there is a little

peg or projection. In fig. 5, about a day later, the root has grown still longer, and this peg seems to be forcing the seed apart. In fig. 6, however, it will be seen that the seed is really being forced apart by the stem or stalk above the peg, for this stem is now growing longer. The lower lobe of the seed has attached to the peg (seen at a, fig. 6), and the seed leaves are trying to back out of the seed. Fig. 7 shows the seed still a day later. The root has now produced many branches and has thoroughly established itself in the soil. The top is also growing rapidly and is still

backing out of the seed, and the seed coats are still firmly held by the obstinate peg. While we have been seeing all these curious things in the seeds which we have dug up, the plantlets which we have not disturbed have been coming through the soil. If we were to see the plant in fig. 7 as it was "coming up" it would look like fig. 8. It is tugging away trying to get its head out of the bonnet which is pegged down underneath the soil, and it has "got its back up" in the operation. In fig. 9 it has escaped from its trap and it is laughing and growing in delight. It must now straighten itself up, as it is doing in fig. 10, and it is soon standing proud and

straight, as in fig. 1. We now see that the reason why the seed came up on the plant in fig. 2 is because in some way the peg did not hold the seed coats down (see fig. 13), and the expanding leaves are pinched together, and they must get themselves loose as best they can.

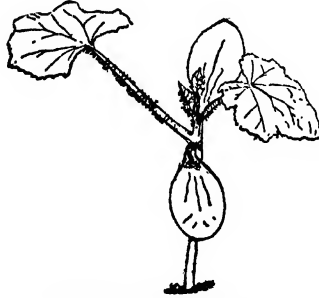

There is another thing about this curious squash plant which we must not fail to notice, and this is the fact that these first two leaves of the plantlet came out of the seed and did not grow out of the plant itself. We must notice, too, that these

leaves are much smaller when they are first drawn out of the seed than they are when the plantlet has straightened itself up. That is, these leaves increase very much in size after they reach the light and air. The roots of the plantlet are now established in the soil and are taking in food, which enables the plant to grow. The next leaves which appear will be very different from these first or seed leaves.

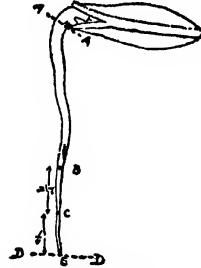

These later ones are called the true leaves. They grow right out of the little

10. The plant straightening up.

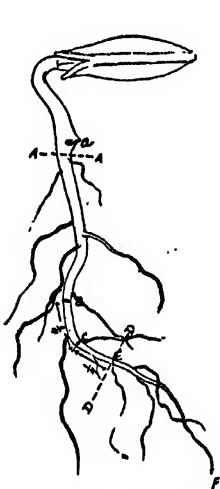

11. The true leaves developing.

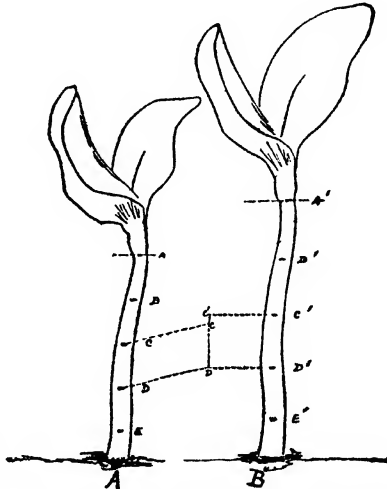

12. Marking the root.

plant itself. Fig. 11 shows these true leaves as they appear on a young Crookneck squash plant, and the plant now begins to look much like a squash vine.

We are now curious to know how the stem grows when it backs out of the seeds and pulls the little seed leaves with it, and how the root grows downward into the soil. Now, let us pull up another seed when it has sent a single root about 2 inches deep into the earth. We will wash it very carefully and lay it upon a piece of paper. Then we will lay a ruler alongside of it and make an ink mark one-quarter of an inch from the tip, and two or three other marks at equal distances above (fig.

13. The root grows in the end portions.

14. The marking of the stem, and the spreading apart of the marks.

12). We will now carefully replant the seed. Two days later we will dig it up, when we shall most likely find a condition something like that in fig. 13. It will be seen that the marks E C B are practically the same distance apart as before and they are also the same distance from the peg A A. The point of the root is no longer at D D, however, but has grown on to F. The root, therefore, has grown almost wholly in the end portion.

Now, let us make a similar experiment with the stem or stalk. We will mark a young stem, as at A in fig. 14; but the next day we shall find that these marks are farther apart than when we made them (B, fig. 14). The marks have all raised themselves above the ground as the plant has grown. The stem, therefore, has grown between the joints rather than from the tip. The stem usually grows most rapidly, at any given time, at the upper or younger portion of the joint (or internode), and the joint soon reaches the limit of its growth and becomes stationary, and a new one grows out above it.

NOTE.—Common ink will not answer for this purpose because it “runs” when the root is wet, but indelible ink, used for marking linen or for drawing, should be used. It should also be said that the root of the common pumpkin and of the summer bush squashes is too fibrous and branchy for this test. It should be stated, also, that the root does not grow at its very tip, but chiefly in a narrow zone just back of the tip; but the determination of this point is rather too difficult for the beginner, and, moreover, it is foreign to the purpose of this tract.

Natural science consists in two things, seeing what you look at and drawing proper conclusions from what you see.

To the TEACHER:

This is the first of a proposed series of leaflets designed to suggest methods of presenting nature study upon common-place subjects. This is a new field of effort for the college of agriculture, and we therefore look upon the methods as largely experimental. We are endeavoring to determine the best way of interesting children in country life. You can give us many suggestions, and we should like a free expression of your opinions and experiences. It should be borne in mind that the object of these lessons is not to impart direct and specific information, but to train the child in the powers of seeing and inquiring. The teacher should keep the attention of the pupil closely fixed upon the germinating seed (when the subject of this leaflet is under review), asking him to describe everything which he sees. Require that the pupil sees all that is specified in this leaflet, and endeavor to lead him on to see things which are not here described. Once the inquiry is started, you will, no doubt, be able to conduct other similar experiments from time to time. If questions come up which you can not answer, write them to us and we may be able to help you.

We suggest that you ask your pupils to write short compositions upon these lessons and to make sketches of the observations, and that you send us some of these from time to time in order that we may learn how the experiment is working. We do not care for the best essays alone, but simply the average. The suggestions which we obtain from teachers will aid us greatly in the preparation of future leaflets.

The WITNESS. This class of leaflets is designed to help the teacher in interesting the pupils in the study of natural objects. So far as possible the plants or animals investigated have some connection with practical agriculture, but the main object is to arouse interest in the rural districts, that the children may know and appreciate the beauties and wonders of plants and animals met with on the farm. None the less, do we try to reach through these leaflets the children of the cities. A single case may be cited for illustration: A teacher of New York City writes me, “We have no land; we can not reach the country, and how can I make use of the leaflets? I see the need of getting the children interested, but how am I to do it?” Later she writes: “I told the children to bring cigar boxes to the school. They were too large to fit on the desks. I then set them to work to cut them down. This gave them something to do. I then sent to the country and got some sacks of rich earth and had the children fill the boxes and plant various seeds which I furnished. This was in midwinter. My schoolroom is one solid garden of squash and corn and bean plants. Each child has a garden upon its desk. Before this it was almost impossible to get the children in the room and get them settled after lunch. They now take 15 minutes for lunch, then assemble in groups during the balance of the noon hour and study these plants. It has transformed my whole school and has worked a miracle.”

Q. Do they study nature in this way from the time the seed goes into the ground until it becomes a mature plant?—A. Yes; study it at any stage of growth; even dig up the seeds before they come up to learn how they germinate.

Q. Do they study the conditions under which the seed must be placed to begin with, in order to learn the chemical changes that take place in the seed to feed the plant?—A. Yes; they get a little of that, but not much chemistry. Life and growth and change are more apparent to children and better understood than chemical changes. What we aim to do is to work without formal text-books; to teach the pupil through personal observation and by means of living teachers.

Q. Is it not almost a necessity for the successful farmer to know what his plant needs and the conditions under which it is growing from the time he plants the seed

until he reaps his crops?—A. Yes; but most farmers are too old to secure this knowledge by studying pure science. They will get what they want to know more certainly through experimental plots. They must ask questions of the soil through the plant and learn to listen carefully for the answer. The thing we need more than anything else in industrial education in agriculture is a differently trained teacher. We shall never transform the rural population as we would like to until the teacher who goes into the school has a knowledge of and is in sympathy with plant and animal life as we find it on the farm, in the wood, and in the garden. The teacher should be able to tell the little child why the strawberry vines are not fruitful and why the strawberry blooms are not fertilized. He must be able to help the child's father to raise more and better potatoes, must know enough of insect life to suggest means of fighting or destroying insect pests. He must assist the farmer, through the child, to work in harmony with nature's modes of action. The father will try an experiment for the child's sake when he will not listen to the suggestions of the most distinguished professor. We try to utilize this love of the parent for the child. In my opinion, the school-teachers of New York, at least, should be required to pass an examination in the simple fundamental principles and practices of agriculture, dairy husbandry, and horticulture before receiving their certificates. I feel we shall never fully succeed until we get back to and behind the teachers in the country schoolhouses.

Q. You suggest that in order to get these teachers the examination should embrace a part of the nature study?—A. Yes, sir.

Q. Have you succeeded in securing that requirement in New York?—A. No; but more and more the authorities who are directing the educational forces of the State are coming into sympathy with our work.

Q. (By Mr. FARQUHAR.) How does the superintendent of public instruction stand in respect to this question?—A. He assists us in every way he can.

Q. What position do the regents of the University of the State of New York take?—A. They are also very favorable to our work, and ask our instructors to go into their teachers' institutes. We have three or four experts this summer who will give courses at the teachers' institutes held at Chautauqua and Alexandria Bay and other places. But there is something I think we shall have to have more than this; that is, the teacher must be trained to make a practical application of the sciences to the affairs of life.

Q. The utility of this class of teaching of nature studies—do you intend to develop it more in the country schools than you would in the city schools, or would you have it all over the State of New York?—A. All over the State.

Q. Would you make any exceptions in the grades? Would you put it into the high school and grammar school as well as the advanced grades of the common schools?—A. Yes; I think something of plants and animals should be taught in every grade in every school of the land. That cannot be done until you get teachers.

Q. (By Mr. LITCHMAN.) You mean to teach this particularly with the idea of raising agriculturists?—A. No; we never ask nor question a student nor a child as to what his life work is to be hereafter. We are trying to round out their education.

Q. What particular advantage is there to a child to spend the time in this special kind of study if his natural inclination is toward a mechanical education?—A. To round out his life and to keep him in touch with nature and nature's God.

Q. Isn't it a waste of time with a student, whose natural inclination is toward mechanics, to try to teach him the rudiments simply of agriculture?—A. I should hardly put it that way. I should try to keep him in touch with the world in which he lives.

Q. Well, he is going into the mechanical world and not the agricultural world; and would it not be an irksome task to a boy who had no natural inclination for that kind of study to force him to learn something that his inclination is against?—A. You can not get him out of the agricultural world.

Q. I am speaking now of the application of natural talents. He is not going to engage in agriculture; he is going to engage in mechanics.—A. Let me answer that by inquiring, Then would you confine his studies only to the mechanical arts? Would you make him a narrow man?

Q. My question indicated only a desire to educate the child in consonance with his natural inclination and not try to drive a square peg into a round hole. My question led to this suggestion, whether it was a good use of the time of the child in school to teach him something which his natural inclination made irksome to him?—A. Isn't that just what we often have to do with a child in laying a good broad foundation?

Q. I am asking your judgment in relation to it. If you think that is a wise thing, I want to make it plain so that you will understand what I am getting at. With a child that shows aptness in a mechanical direction, do you think it advisable—will he not use time for what at the most would be a superficial education in agricultural pursuits?—A. I should want every child to have some knowledge of plants and the

environment in which it lives. In other words, I would want him to know a great deal of one thing and a little of a good many things, which it is said constitutes a liberal education.

Q. Well, then, you put it on the ground of broadening the child's intelligence, and not with the idea that it may wean him away from his natural inclination and make an agriculturist of him?—A. Oh, no, I would like to have the child go through the world with his eyes open, if you please, and make his living out of his specialty; so that the child—the man or woman—can speak with some degree of intelligence about those ordinary things with which we all have to do.

Q. Do you think that the course of modern education and the tendency of modern demands is toward specialization rather than generalities?—A. Specialization in the latter part of one's education always, and a broad foundation at the beginning.

Q. Your idea is that this liberal foundation will develop the natural aptitude of the child?—A. Yes.

Q. And then, I may say, to pursue that course along that line of natural aptitude?—A. Yes; but you can not touch any phase of life without touching your environment—that is, the soil, the plant, and the animal. I could not get my breakfast this morning without touching upon my environment.

Q. Is it necessary for the average mechanic to have a knowledge of the construction of plants and education of that sort in order to appreciate his breakfast?—A. I think that children in youth should not be forced to take a course in agriculture or study an agricultural text-book in school; but I do think every child can be taught and energized and made to be a better man or a better woman in after life by coming in contact with living things and knowing something of how they grow and what they are. I should hate to have my daughter, who is a specialist, not know a rose from a chrysanthemum.

Q. Do not understand me as antagonizing your position. I merely wanted to draw out how far you had taken the line in connection with the natural aptitude of a child for any special line of work, and how far you would use the time of a child who had not a natural aptitude. For instance, take a child who had a natural inclination to music; it may be most irksome to him or her to, what she would call, waste her time in studying plants when her whole desire was to study music.—A. I will answer by saying nature studies are rest studies.

Q. I see the force of that.—A. There is no lesson to be gotten; there is no examination; but the teacher induces each child to bring a box of earth and plant seeds. I do not know of any child who has got so far away from childhood's curiosity as not to be immensely interested in such work.

The boy who came to me the other day with six toads in his pocket I do not expect will become a farmer, but he has got intensely interested in the toads about our reservoir. Being interested and energized in seeing how much he can learn about the toads, we can now turn him out, trusting that he will be interested in everything. His eyes are opened, and if he studies a turning lathe he will study it with so much more care.

We find that we must start at the bottom with the children, and so have organized Junior Naturalists' clubs throughout the State. There are 764 of them. Their membership dues consist in writing a letter at stated times to the head of this bureau. There are 20,321 members enrolled in these clubs. The natural objects studied give material for the drawing lessons. After the work is completed one school may exchange drawings with another school through the medium of the nature-study bureau.

There is also a home nature-study course in which 1,400 are registered. The instructors who go out through the country visit these clubs as well as the farmers who are conducting experiments. The map herewith presented indicates where the farmers are cooperating with us in the work of investigation. We have no map showing the location of the various clubs and reading circles.

Q. (By Mr. FARQUHAR.) Are these nature studies somewhat in the character of the Chautauqua studies?—A. No, I think not. They are not so extended in scope, and the main effort is to get the pupils in nature-study interested; open their eyes and get them to asking questions; and you would believe that we have succeeded if you could see our daily mail.

Q. Then the questions are propounded from your college in this nature study, passing all over the State through your leaflets?—A. Yes.

Q. And correspondence is also maintained in answer to those questions?—A. Yes, and any other questions.

Q. Is there any subsidiary teaching, also, in connection with it; any of those connected with the college that go to the institutes or elsewhere in the State? Do they have anything to do with the nature studies?—A. Yes. Where there is a club formed they may request that a teacher be sent to speak upon a definite subject.

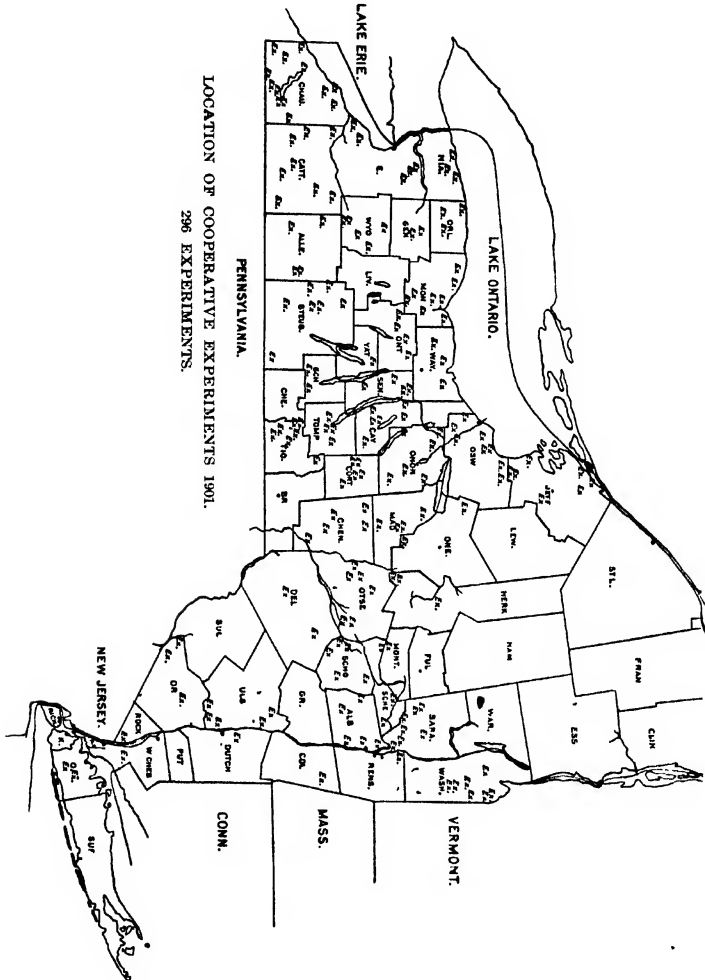

Q. So that your teaching is not altogether by correspondence that simply answers the questions?—A. No.

Q. You have practical teaching?—A. Yes; the map referred to represents that a man

has been to nearly every one of those places. We may reach only one man who is experimenting, but when our representative is there he may gather the local club together and give a lecture.

Q. Are your leaflets adapted to quite young minds as well as to more mature ones?—A. Yes, sir.

Q. Have you a graded system of putting out your leaflets?—A. Yes, we have different publications for different classes of pupils. The farmers' reading course publications are quite different from those designed for farmers' wives. One instructor

has full charge of the farmers' reading course, another of the farmers' wives reading course, another of the school teachers' course, and still another of the children's course. An entirely different sort of publications goes to the investigators. They give specific directions as to what is to be done and how to do it. Blanks are furnished for reporting results. When these reports are received in the winter they are discussed, digested, and, so far as may be, published in the form of a bulletin. Such a one is now in press giving the results of last year's investigations throughout the State.

We receive many thousands of letters in regard to the various educational activities which are being carried on throughout the State for the promotion of agriculture. They are an aggregation of fact, fun, and philosophy. It would not be wise to give the authors' names. Here is one from a New York printer out of business. You will find it marked "1" in the *World's Work*, June, 1901. We find a large number of persons who have partly failed in life, have got tired of the routine of city life and desire to retire on a little land, and these are among our best students. (Following is a copy of the letter in the *World's Work*, June, 1901, p. 811, above referred to.)

"I am just past 50 years old, healthy, but only weigh 110 pounds. Am a New York printer out of business and too old to get steady work. They want a younger man; besides my eyes are giving out. The only thing left for me to do is to go 'backwards to Eden,' and try to earn my living at farming in a small way. In pursuance of this plan I have leased a small place in New Jersey, 27 acres, with small house and dilapidated barn, cow shed, and corncrib. I took possession on February 1, last. I have means enough to pay a year's rent at \$12 per month, buy a cow, 6 young pigs, 50 chickens, a horse and dog, and some tools and seed, and live for 1 year. After that it must support me and a housekeeper and 14-year-old boy, who will also have to go to school. You ask what are my special difficulties. Aren't these them? Special and general! There is no choice in the matter; it is this or the poorhouse, with a chance of this and the poorhouse at the end of the year. I simply must make it succeed. I shall make mistakes, and if you care, or if it interests you, I will report success or failure, so you can hold me out as a light-house. I call the place Forlorn Hope—Last Ditch."

Another man says: "I enjoy the study, for it is good sense, and until the farmer knocks a few scientific facts into his head he will continue to lose more than he gains. I consider the way you go about helping the farmer is by far the best investment possible of the little State's money. I admire your noble work, and I want to study with you. Please send me the new studies as they come out, and believe me to be."

Here is a letter from a boy in Pennsylvania. (I may say that some of our work sometimes laps over into adjoining States.) He says: "My Dear Cornell: It pleases me very much indeed that you have not forgotten your delinquent Pennsylvania boy. You know I dropped out while my wife was so sick. She is once more getting well and I am glad. Anything from Cornell is always welcome here, and in my blundering way I have endeavored to answer your questions. I hope to hear a speaker from Cornell, somewhere, this winter."

The fourth is rather a curious letter.

(Reading:) "I am a little dubious about the wisdom of further pursuing this reading course. It has helped me to become a better farmer than most of my neighbors, which in many cases has aroused their envy and hatred."

You see the prejudice is not all gone in the country any more than it is all gone in the city. (Reading:) "I am fast losing friends; becoming isolated in consequence. My crime is, I am raising 10 bushels of grain and 3 of potatoes to their one. If I should, in the near future, grow a fine orchard they might mob me."

In regard to this letter, I may say that for 8 or 10 years we have been making strenuous efforts to improve the potato culture of the State. We found that the average yield in New York was less than 100 bushels. We found also that we were able to raise anywhere from 200 to 400 bushels of potatoes without manures or fertilizers by emphasizing tillage. Now, we have gone out through the country endeavoring to induce the farmers to raise potatoes the Cornell way and also their own way, side by side. We received about 300 replies from these potato growers last year, and with only one exception every man said this is a great improvement.

Here is another one (reading): "The reading course has been a help to me the past summer in the way of raising crops. Through these lessons I have obtained 100 bushels of potatoes of salable size from one-half acre of ground, in spite of the unusually dry year. There is nothing that I can say to criticize or condemn. I am thankful to the State and to the college for placing these lessons in my reach."

Another (reading): "I don't know how to address you, and there are lots of poor old broken-down farmers in the same boat, but I will call you Cornell, so I will address you thus: Friend Cornell: I feel very much interested in your reading course. If you have got a pet name inform your readers. They are loyal and obey orders. Excuse us for not answering you according to your plans. We want to file all your matter so that if our business does not drive us too hard we can refer to them in the future."

You observe from these letters that we have got into touch with the farmer. That is the main thing. We are no longer in the old condition where the farmer hated the scientific man and the college professor, and where the college professor despised the farmer. The missing link has been found. I think this part of our work is to be emphasized more than all the other details—that we apparently have found the missing link and broken down prejudice.

Drudgery transformed (reading): "Although a Canadian farmer boy, you were kind enough to send me your farmers' reading course. After reading the five lessons on the soil and the plant, as I trudged up and down through the furrows, every stone, every lump of earth, every sandy knoll, every hollow had a new interest. The day passed, the work was done and I had no experience."

It seems to me this is the best letter we have ever received. We have opened the boy's eyes and set him to asking questions, and we are ready to answer his questions, no matter how simple they may be. Some 22 of us are now engaged in the College of Agriculture, in the work of teaching at home and throughout the State and in experimenting. When I began there were 3 of us.

Professor Craig says in his summing up of these letters, "Is not this the key to the whole situation? Vivify a task by introducing the child's eternal 'why?' and what was irksome becomes attractive; what was a labor becomes a recreation. Scientific and industrial education must be developed downward as well as upward. Its foundation should be laid in the farm home and the rural school. Correspondence courses in agriculture strive to repair defects of early education of the farmer with a view of placing him in full harmony with his surroundings."

The following is a sample of many letters which are received, and is unique in one respect, in that it is written by the secretary of the Hundred Year Club of New York City:

NEW YORK, June 1, 1901.

I. P. ROBERTS, *Director, Ithaca, N. Y.*

DEAR SIR: Enclosed find address card. I certainly do most earnestly desire to continue to receive your bulletins, which are to me more fascinating than anything I have read since I sat up nights to read Dr. E. K. Kent's narrative of his search for the North Pole.

I have not many of the Ithaca bulletins, but those of the United States Department of Agriculture occupy the post of honor at my right hand and are in constant request, being suitably classified for instant reference and study.

I am passionately fond of the soil and all that that implies, and it is a sad moment that tears me away from my plants to get down town to office business. Happy mortal, you, to be able to saturate yourself to the core with the oil of sunshine and all manner of growing "herbs" and the fruits of the earth. Not to be acquainted with the tilth of a garden spot is to miss three-fourths of life. "What fools these mortals be" to desert the sweets of the rural world for the turmoil and hazard of city employment.

But enough. I inclose a list of bulletins which I shall prize if permitted to possess; and I shall see to it, that each and all shall find a prominent preservative in kindred company in library binding for other eyes after mine shall have ceased to sop up knowledge, and my hands shall have ceased to caressingly crumble the soft leafy mold of my beloved garden.

Sincerely yours,

Q. (By Mr. WEST.) What are the relations between the college of agriculture and the other departments of the university?—A. The college of agriculture has its separate faculty, and all things which have to do with the college are decided by this faculty. Those things which have to do with more than one college are finally decided by the general faculty of the university. About one-half of the work in the 4 years' course in agriculture is given by associate colleges, and one-half by the college proper.

Q. Are the students in the college of agriculture for the most part sons of farmers of New York State?—A. Not of New York State necessarily. About nine-tenths are sons of farmers. We have students from other States and foreign countries. Nearly all the special and winter course students are from New York State.

Q. Is there any tendency among your students to change their course and take work in other courses?—A. During the year generally 1 or 2 students change from the course in agriculture to other courses, and a like number from other courses change to the course in agriculture.

Q. In what way do the students in the other departments of the university become interested in agriculture?—A. Students find that they are not adapted to the work pursued, do not like it, and coming in contact with the college of agriculture and finding it is a strong college, that its students readily find positions, they change over to it. The various courses of study, in the first and second year, are so laid out as to make it easy to change over from one college to another at the end of the sophomore year.

Q. It is not a development then from pure science to applied science?—A. No; because the college of agriculture and most of the other technical colleges have a great deal of pure science in them. The scheme in the college of agriculture is for a student to spend 2 years in training and scientific studies, or the larger part of 2 years, and

then mass his work in his junior and senior years on subjects directly relating to agriculture, thereby hoping to give to the student (now that we have such high requirements) both a liberal and practical education. In the junior and senior years, at least one-half of the student's work must be purely agricultural. You will notice that the higher mathematics and 2 years of French and 2 years of German are required for entrance or an equivalent of them. The scheme is, first, to give a course in agriculture that shall be equivalent in training, both as to entrance and work in the college, to any of the first-class scientific or literary colleges in the land to produce a man who is not inferior to any graduate of any other college. Second, to offer opportunities to students from other colleges to pursue their studies for 1 or more years after taking bachelor's degree. Third, to offer shorter courses for the farm boys who want pure agriculture and do not care to study the pure sciences and the languages. Fourth, to make provision for farm boys and girls who desire to pursue the study of agriculture for short periods in order to become acquainted with the latest research and most improved methods. Fifth, to furnish through a correspondence bureau and traveling teachers facilities for farmers, their wives, and their children, to secure help and instruction along the lines of their life work, by means of letters, occasional lectures, printed literature, and examination papers.

Q. What administrative machinery have you for placing your graduates in positions?—A. None whatever. We receive applications for men from colleges, experiment stations, owners of large estates, of creameries and cheese factories, etc.

Q. Just what is the relation of the experiment station to the college of agriculture?—A. The experiment station is a department of the college of agriculture. The work for the promotion of agricultural knowledge throughout the State is carried on by reason of a State appropriation of \$35,000. This is also a department of the college and this work is carried on along three somewhat distinct lines:

(1). Instruction at the university (the winter course).

(2). Instruction throughout the State: (a) To farmers (reading course); (b) to farmers wives (reading course); (c) to school teachers (nature study); (d) to school children (nature study).

(3). Investigations throughout the State (the cooperative experiments).

Q. What is the relation of the Cornell Experiment Station to the Geneva Station?—A. One of cooperation in the most friendly manner possible. Two or three cooperative bulletins have been published, one part being written by a Geneva Station man and the other part by a Cornell man.

Q. How does it happen that there are 2 experiment stations in New York State?—A. Many years ago an effort was made to establish an experiment station by the Hon. A. D. White, ex-president of Cornell University, and his associates. Finally, a law was passed by the State legislature making provision for a board of trustees to report upon the advisability of establishing such a station. This board (appointed by the Governor) thought it would be wise to have the station separate from the university, and therefore the State station was located at Geneva. Later, when the Hatch act was passed it was thought wise by the legislature to establish the Government station at the land grant college, and therefore two stations, one maintained by the State and one by the Federal Government. The Cornell Station was given the federal fund of \$15,000 until a few years since, when the legislature elected to give \$1,500 of this fund to the State station with the view of securing for that station the franking privilege.

Q. Are there any agricultural schools in New York State under private auspices? A. One at Briarcliff Manor, Director (George T. Powell). The academy at Belleville, endowed and maintained quite largely by the farmers of the district, has established a chair of agriculture, and agriculture is to be taught as one of the regular academic studies. Mr. E. M. Baxter, one of our graduates, has been elected as principal, and Mr. G. M. Bentley, another graduate, as assistant.

Q. How are these private schools able to secure students, when tuition is free at Cornell?—A. Because they are located near the large cities where there are sons of wealthy men, who have failed to prepare themselves for the ordinary professions or for business and have apparently no aptitude to follow the profession of their fathers. Usually, these boys love an out-of-door life better than books and these schools provide opportunity for them to become interested in plant and animal life. There are a great many persons who do not readily acquire abstract knowledge. There is great need in this country for agricultural schools where boys can find instruction in one or more specific lines of agricultural work, as dairy husbandry, horticulture, gardening, and the like. I wish there were at least a dozen of these schools in New York State.

Q. (By Mr. A. L. HARRIS.) The commission will probably desire a few specimen copies of your teachers' leaflets to insert either in whole or in part as a part of your testimony. You have left a number here, and probably you could designate those that are most important.—A. I will do so later, and file copies with you.

Q. That will be entirely satisfactory. Have you anything additional that you desire to say?—A. I might say that the awakening in the rural districts among the teachers of the country in the State of New York is very marked. We are greatly encouraged, and we now see as we have not seen before, after all this work, the need of a somewhat modified training of the teachers, especially those who are to teach in the country. We do not like to say that these teachers shall be compelled to go somewhere—for instance, to Cornell University—and take a course of 3 months, one term, in order to get in touch with this work; but nevertheless we do not see how these teachers are to be energized, until two or three generations are passed, without such provision. Bright well trained girls go to our country districts knowing little about the natural objects which surround them. They are not original because they have little or no training in rural affairs. It is not farmers we are trying to make in this work. We aim to give help to the people who live in both country and town and to stimulate their love for rural affairs.

Q. (By Mr. LITCHMAN.) About everything in this vast country of ours is approached from the utilitarian standpoint. Now, what have you to say in relation to your proposition from that standpoint?—A. You have not made a man or a woman until you have developed both sides of their natures. A man or woman is of very little value who can not take care of himself or herself. Then we want a citizen, a man or a woman who gets more out of life than their daily bread.

Q. Is it not true of the vast majority of pupils in the public schools that the utilitarian standpoint is the first to be considered—the ability to earn the daily bread?—A. Yes; but the first effort should be to develop the physique of the boy and girl so they will be strong. The second is to teach them how to get a living. The third is to give them all we can of the higher ideals, according to their capacity and environment.

Q. Is it your idea that this broader knowledge will give a higher enjoyment of the things they are able to acquire through their knowledge of the utilities of life?—A. Yes. I believe the true road to the highest mental development is by the way of the utilities in youth. When the child is young you want to train the hand. Heretofore the old education, as I have looked at it, tried to educate one man's brain and another man's hand; and too frequently two monstrosities were produced. Now we are trying to develop a harmonious man.

Q. Trying to develop a man in whom the brain and brawn will act together?—A. Yes; physically, manually, mentally, and morally. One follows the other naturally.

Q. I take it, then, you are in favor of what is called manual training in the public school education?—A. Yes.

Q. How early in the education of the child would you begin that?—A. As soon as the child shows constructive instincts.

Q. It has been in evidence before our commission that it would be wise to make manual training a part of the curriculum of the public school. I take it from your testimony you are in favor of that proposition?—A. Certainly. I believe a student trained to use his hands will acquire what we call the higher education far more rapidly than one not so trained, and that higher education will be of far more value to the man if he can sympathize with and appreciate the man below him. I would not make this a hard and fast system in the manual training school; I would give opportunity for originality in the child.

Q. The testimony given here that advocated the joining of the manual training with the public school indicated a desire to make it an adjunct and not to supplant it. That would be your idea also?—A. Yes; fewer studies and greater thoroughness.

Q. Would you indicate what you mean by fewer studies—the ones you have in view?—A. I expected to be a farmer, and I do not believe the time I spent on Latin, though it was not very long, was of benefit to me. I did not get enough to give me a working tool, and I should have devoted that time to learning something of my chosen profession, agriculture. I found myself at 30 years of age without any real training, except such as I had picked up by practice, for my profession of teaching agriculture. I find the boys who come to me in the same condition. We have to go clear back and teach them things they should have been taught in the schools. Education at the university is expensive in these modern days, and for one to pay out \$300 to \$1,000 a year to maintain himself, and then be compelled, if he is to be at all thorough, to study things that any boy of 14 ought to know, is humiliating.

A clear statement of what nature study is is found in Teacher's Leaflet No. 6, which is filed herewith. This has gone to the tenth edition. Our lessons for the promotion of agriculture throughout the State have to do, first, with the soil, second, with plants, and third, with animals. A good illustration of the work on the soil and what it is is found in Cornell reading course for farmers No. 1, November 18, 1898, together with a quiz on reading lesson No. 1, by John W. Spencer.

(The leaflets referred to are reprinted on the following pages.)

[Teacher's leaflets for use in the rural schools. Prepared by the College of Agriculture, Cornell University, Ithaca, N. Y. Issued under the auspices of the Experiment Station Extension, or Nixon Law, by I. P. Roberts. Tenth edition. No. 8. May 1, 1897.]

WHAT IS NATURE STUDY?—BY L. H. BAILEY.

It is seeing the things which one looks at and the drawing of proper conclusions from what one sees. Nature study is not the study of a science, as of botany, entomology, geology, and the like. That is, it takes the things at hand and endeavors to understand them without reference to the systematic order or relationships of the objects. It is wholly informal and unsystematic, the same as the objects are which one sees. It is entirely divorced from definitions or from explanations in books. It is therefore supremely natural. It simply trains the eye and the mind to see and to comprehend the common things of life; and the result is not directly the acquirement of science, but the establishing of a living sympathy with everything that is.

The proper objects of nature study are the things which one oftenest meets. To-day it is a stone; to-morrow it is a twig, a bird, an insect, a leaf, a flower. The child, or even the high-school pupil, is first interested in things which do not need to be analyzed or changed into unusual forms or problems. Therefore, problems of chemistry and of physics are for the most part unsuited to early lessons in nature study. Moving things, as birds, insects, and mammals, interest children most, and therefore seem to be the proper subjects for nature study; but it is often difficult to secure specimens when wanted, especially in liberal quantity, and still more difficult to see the objects in perfectly natural conditions. Plants are more easily had, and are therefore more practicable for the purpose, although animals and minerals should by no means be excluded.

If the objects to be studied are informal, the methods of teaching should be the same. If nature study were made a stated part of a curriculum, its purpose would be defeated. The chiefest difficulty with our present school methods is the necessary formality of the courses and the hours. Tasks are set, and tasks are always hard. The only way to teach nature study is, with no course laid out, to bring in whatever object may be handy and to set the pupils to looking at it. The pupils do the work—they see the thing and explain its structure and its meaning. The exercise should not be long, not to exceed 15 minutes at any time, and, above all things, the pupil should never look upon it as a recitation, and there should never be an examination. It should come as a rest exercise whenever the pupils become listless. Ten minutes a day for one term of a short, sharp, and spicy observation upon plants, for example, is worth more than a whole text-book of botany.

The teacher should studiously avoid definitions and the setting of patterns. The old idea of the model flower is a pernicious one, simply because it does not exist in nature. The model flower, the complete leaf, and the like, are inferences, and pupils should always begin with things and not with ideas. In other words, the ideas should be suggested by the things, and not the things by the ideas. "Here is a drawing of a model flower," the old method says; "go and find the nearest approach to it." "Go and find me a flower," is the true method, "and let us see what it is."

Every child, and every grown person, too, for that matter, is interested in nature study, for it is the natural method of acquiring knowledge. The only difficulty lies in the teaching, for very few teachers have had any drill or experience in this informal method of drawing out the observing and reasoning powers of the pupil wholly without the use of text-books. The teacher must first of all feel the living interest in natural objects which it is desired the pupils shall acquire. If the enthusiasm is not catching, better let such teaching alone.

All this means that the teacher will need helps. He will need to inform himself before he attempts to inform the pupil. It is not necessary that he become a scientist in order to do this. He simply goes as far as he knows, and then says to the pupil that he can not answer the questions which he can not. This at once raises his estimation in the mind of the pupil, for the pupil is convinced of his truthfulness, and is made to feel—but how seldom is the sensation—that knowledge is not the peculiar property of the teacher, but is the right of anyone who seeks it. It sets the pupil investigating for himself. The teacher never needs to apologize for nature. He is teaching simply because he is an older and more experienced pupil than his pupil is. This is just the spirit of the teacher in the universities to-day. The best teacher is the one whose pupils the farthest outrun him.

In order to help the teacher in the rural schools of New York, we have conceived of a series of leaflets explaining how the common objects can be made interesting to children. While these are intended for the teacher, there is no harm in giving them to the pupil; but the leaflets should never be used as texts to make recitations from. Now and then take the children for a ramble in the woods or fields, or go to the brook or lake. Call their attention to the interesting things which you meet—whether you yourself understand them or not—in order to teach them to see and to find some point of sympathy; for everyone of them will some day need the solace and the rest which this nature-love can give them. It is not the mere information

which is valuable; that may be had by asking some one wiser than they, but the inquiring and sympathetic spirit is one's own.

The pupils will find their lessons easier to acquire for this respite of 10 minutes with a leaf or an insect, and the school-going will come to be less perfunctory. If you must teach drawing, set the picture in a leaflet before the pupils for study, and then substitute the object. If you must teach composition, let the pupils write upon what they have seen. After a time, give 10 minutes now and then to asking the children what they saw on their way to school.

Now, why is the College of Agriculture of Cornell University interesting itself in this work? It is trying to help the farmer, and it begins with the most teachable point—the child. The district school can not teach agriculture any more than it can teach law or engineering or any other profession or trade, but it can interest the child in nature and in rural problems and thereby fasten its sympathies to the country. The child will teach the parent. The coming generation will see the result. In the interest of humanity and of country, we ask for help.

TO THE TEACHER:

The following leaflets have been issued to aid teachers in the public schools in presenting nature-study subjects to the scholars at odd times.

1. How a squash plant gets out of the seed.
2. How a candle burns.
3. Four apple twigs.
4. A children's garden.
5. Some tent-makers.
6. What is nature-study?

Address, Chief Clerk, College of Agriculture, Ithaca, N. Y.

[Cornell reading course for farmers. Issued by the College of Agriculture, Cornell University, Ithaca, N. Y., in the months of November, December, January, February, and March. Reading lesson No. 1. November, 1900. 3d edition. By L. H. Bailey.]

THE SOIL: WHAT IT IS.

1. *The basis of soil is fragments of rock.*—As the earth cooled the surface solidified into rock. The processes of nature have been constantly at work in breaking up this rock and making it into soil.

2. *Weathering is the great agency in making rocks into soil.*—Rain, snow, ice, and frost have worn away the mountains and deposited the fragments as soil. Probably as much material has been worn away from the Alps as still remains, and this material now forms much of the soil of Italy, Germany, France, and Holland. Our own mountains and hills have worn away in like manner.

3. *Weathering is still active.*—All exposed rocks are wearing away. Stones are growing smaller. The soil is pulverized by fall plowing.

4. *The particles of soil are worn and transported by water.*—Every stream carries away great quantities of soil and deposits it in the shallows and the bays. After every rain the streams and ponds are muddy or roily. Observe the sediment or fine mud which remains when a "mud puddle" dries up. The smallest rivulet carries away tons of earth every year; and this earth is deposited somewhere, and sometime it may, perhaps, come into use again for the growing of plants. Many of our best and richest farm lands are the deposits of former streams and lakes. Such lands are fine and silt-like. Most lowlands belong to this category; and even some of our higher lands are formed from deposits from water. The mixed and varied character of soils is largely due to the fact that they are the results of transportation from different places.

Observe the flat lands about lakes. These flats are formed by the deposition of material from the surrounding highlands; but they are often exposed before their natural time by the lowering of the water level in the lake. All lakes and ponds are filling up. Nearly every stream makes a delta at its mouth; but if the stream into which it empties is swift the delta may be carried away.

Observe, also, the broad rounded hillocks and knolls in valleys and ravines. Many of them have attained their present form from the action of moving water.

Every farmer knows that overflowed lands are rich. He has heard of the wonderful fertility of the Nile. He should explain these facts.

5. *All productive soils also contain organic matter.*—Organic matter is the remains of plants and animals. As found in soils in a decaying condition, it is called humus. It is the humus which gives the soil its dark or "rich" look. It also tends to make soils loose, warm, and mellow. It holds moisture. The addition of humus makes soils loamy. A sandy loam is a soil of which the original mineral matter is sand, and a clayey loam is one of which the basis is clay. Soils which have no humus are hard, "dead," and unproductive.

6. *Humus is supplied by means of roots and stubble, green crops, and barn manures.*—If the farmer practices a rotation of which meadow and pasture are a part, the supply of humus will be maintained. In such cases green manuring is unnecessary, except now and then upon lands which are very hard or poor. The roots and stubble, with the droppings of the animals on the pasture, and manure applied with one of the crops in the rotation, keep the land well supplied with vegetable matter. Whenever possible, it is better to feed the crop to stock and return the manure to the land than to plow the crop under, for one will get back the greater part of the fertilizing value of the crops and maintain the animal at the same time. In western New York there are hundreds of acres of refuse lands, and at this day there are thousands of tons of herbage on the ground and no stock to eat it. It is wasteful.

Many soils which are said to be worn out are robbed of their humus rather than of their plant-food; others have been injured in their texture by careless or faulty management. In supplying humus, it is better to add small quantities often. Lands which are under constant tillage, in corn, wheat, oats, and potatoes, may be supplied with humus if catch crops are sown with the crop, now and then, late in the season. Rye, Canada peas, crimson clover, and the like may be used for this purpose. Plow them under as soon as the land is ready in the spring, even if the plants are not large.

Observe how the forest supplies its humus. Year by year the leaves add to the soil cover, slowly passing into vegetable mold or humus. The trunks finally decay and pass into the soil. The work is effectively done, but it consumes time; and man is in a hurry. When the forest is removed the land is very productive. It is called "virgin soil," notwithstanding the fact that an enormous crop of trees has just been taken from it, and that it may have grown hundreds of such crops. The real virgin soil is the barren soil. But however rich this forest soil may be when the timber is first removed, it generally soon loses its exuberant fertility. The pigny crops of the farmer seem to be harder on the soil than the gigantic crops of nature. Some of this loss of productivity is due to the loss of humus.

A rotation prevents the exhaustion of plant food, supplies nitrogen in leguminous crops, one crop leaves the land in better condition for another, the roots and stubble improve the texture of the soil, it keeps weeds in check, provides for continuous labor because stock is kept.

The rotation should differ with the kind of soil and general style of farming. The Cornell rotation is:

Wheat.
Clover and timothy, 1 year.
Maize (corn).
Oats.

A good rotation for weed-infested land is.

Sod, 1 year.
Maize.
Potatoes, or some other tilled crop
Oats or barley.

On fruit farms rotations are not so practicable as on grain farms; but the fields which are not in fruit can often be worked in rotation to great advantage. The general tendency of fruit farmers is to keep too little stock. If stock can not be kept, the humus can be maintained by catch crops and cover crops.

7. *The fertility of the land is its power to produce crops. It is determined by three things: The texture of the soil, its richness in plant food, and its available moisture.*—The texture of the soil is its physical condition—as to whether it is mellow, loose, leachy, cloddy, hard, and the like. A rock or a board will not raise corn, and yet it may contain an abundance of plant food. The plant can not get a foothold, and it would do no good to apply fertilizers. Spreading potash on a lump of clay is not farming; it is the wasting of potash. A cow will not appreciate the fanciest ration if she is uncomfortable; neither will a plant. It is only on land which is in good tilth that fertilizers pay. The better the farming, the more it will pay, as a rule, to buy plant food; but poor farmers can not make it pay.

8. *Nature secures good texture in soil by growing plants in it.*—Roots make the soil finer, and plants supply it with humus. Plants break down the soil by sending their roots into the crevices of the particles, and the root acids dissolve some of it. Observe nature working at this problem. First the "moss" or lichen attacks the rock; the weather cracks it and wears it away; a little soil is gathered here and there in the hollows; a fern or some other lowly plant gains a foothold; year by year, and century by century, the pocket of soil grows deeper and larger; and finally, the rock is worn away and crumbled and is ready to support potatoes and smartweed; or, the rock may be hard and bare and you can not see any such process going on. Yet, even then, every rain washes something away from it and the soil beneath it is constantly receiving additions. Some soils may be said to be com-

pleted—the rock is all broken down and fined; other soils are still in process of manufacture—they are full of stones and pebbles which are slowly disintegrating and adding their substance to the soil. Did you ever see a “rotten stone?”

The longer plants are grown on any soil and returned to it, the richer the soil becomes. But nature has centuries at her disposal; man has but a few short years and must work rapidly, and he can not afford to make mistakes.

9. *The texture of the soil may be improved; (1) by underdraining; (2) by tilling; (3) by adding vegetable matter; (4) by adding certain materials, as lime, which tends to change the size of the soil particles.*—The reader will say that nature does not practice tile draining. Perhaps not; but then, she has more kinds of crops to grow than the farmer has, and if she can not raise oats on a certain piece of land she can put in water lilies. We shall have an entire lesson devoted to drainage and tillage and also one to manures and fertilizers. It is enough for the present to say that the roots which are left in the ground after the crop is harvested are very valuable in improving the soil. This is particularly true if they are taproots—if they run deep into the soil. Clover bores holes into the soil, letting in air, draining it, warming it, and bringing up its plant food. Roberts reports (“Fertility of the Land,” p. 345) that a second growth of clover, two years from seeding, gave a yield of air-dried tops of 5,417 pounds per acre, and of air-dried roots 2,368 pounds in the first 8 inches of soil. Add to this latter figure the weight of roots below 8 inches and the stubble and waste, and it is seen that the amount of herbage left on the clover field is not greatly less than that taken off. In this instance the roots contained a greater percentage of nitrogen and phosphoric acid than the tops and about the same percentage of potash.

Make an estimate of what proportion of the plant growth you raise is actually taken off the field. Figure up, as accurately as you can, the portion left in roots, stubble, leaves, and refuse. Even of maize you do not remove all from the field. This calculation will bring up the whole question of the kind of root-system which each sort of plant has. Have you ever made a close examination of the roots of potatoes, maize, wheat, clover, cabbages, buckwheat, strawberries, Canada thistles, or other crops? From what part of the soil do these plants secure their nourishment? What power have they of going deep for water? What proportion of them is root? Because the roots are hidden we have neglected to examine them.

10. *The soil is plant food; but this food becomes usable or available slowly.*—Roberts has compiled the analyses of 49 representative soils made by American chemists, and the following is the result: “The tables reveal the fact that even the poorer soils have an abundance of plant food for several crops, while the richer soils in some cases have sufficient for 200 to 300 crops of wheat or maize. The average of 34 analyses gives to each acre of land, 8 inches deep, 3,217 pounds of nitrogen, 3,936 pounds of phosphoric acid, and 17,597 pounds of potash, and this does not include that which is contained in the stones, gravel, and sand of the soil which will not pass through meshes of one-fiftieth of an inch, which, by weathering and tillage slowly give up their valuable constituents.—Roberts’s “Fertility of the Land,” p. 16.

Fortunately this great store of plant food is locked up, else it would have leached from the soil or have been used up long ago. By careful husbandry a little of it is made usable year by year; and the better the management of the land the more of this food is available to the plant. When the farmer has done his best to get out of the land all that it will give him, then he may add fertilizer for bigger results.

Plant food is available when it is in such condition that the plant can use it. It must be both soluble and in such chemical form that the plant likes it. Plant food which is not soluble in rain water may still be soluble in soil water (which contains acids derived from the humus); and the acid excretions from the roots may render it soluble. But solubility is not necessarily availability, for, as we have said, the materials must be in such combination that the plant will take them. Thus, nitrate of soda (NaNO_3) is available because it is both soluble and in the form in which the plant wants it. But nitrite of soda (NaNO_2) is not available although it is soluble—the plant does not like nitrites.

11. *Nitrogen must probably be in the form of nitrates before it can be used by most plants.*—Nitrogen is abundant. It is approximately four-fifths of the atmosphere, and it is an important content of every plant and animal. Yet it is the element which is most difficult to secure and to keep and the most expensive to buy. This is because the greater part of it is not in a form to be available, and because when it is available it tends to leach from the soil. It is available when it is in the form of a nitrate—1 part of nitrogen, 3 parts of oxygen, united with 1 part of some other element (NaNO_3 , nitrate of soda; KNO_3 , nitrate of potash or saltpeter; HNO_3 , nitric acid, etc.). The process of changing nitrogen into nitrates is called nitrification. This process is the work of germs or microbes in the soil; and these germs work most efficiently when the soil is not water-logged, and when it is well tilled. The farmer should make his nitrogen supply as he goes along, and he makes it with tile drains, plows, harrows, and cultivators.

But there are some plants which have the power of using the nitrogen which is in the air in the soil. These are leguminous plants—clovers, peas, beans, vetch, alfalfa. If, therefore, the farmer can not secure sufficient nitrogen by other means, he may use these plants as green manures. If his system of farming will not allow him to use these plants, or if he does not secure sufficient nitrogen when he does use them, then he can go to the warehouse and buy nitrogen.

12. *The soil is not a mere inert mass; it is a scene of life and activity.*—This is the new and the true teaching. Soil which is wholly inactive is unproductive. Movements of air and water, actions of heat and evaporation, life rounds of countless microscopic organisms, decay, and disintegration of plants and soil particles—these are some of the activities of the fertile soil. If our ears were delicate enough we could hear the shuffle of the workers, the beating of the hammers, and the roll of the tiny machinery. All things begin with the soil, and at last all things come back to it. The soil is the cemetery of all the ages, and the resurrection of all life. If the soil is not idle, neither should the farmer be.

NOTE.—Persons who desire to pursue this subject further should procure King's book "The Soil" and Roberts's "Fertility of the Land," published by the Macmillan Co., New York, at 75 cents and \$1.25, respectively.

[This reading lesson is sent free to all persons in New York State who are interested in agriculture. A supplement or quiz accompanies it, asking questions on the lesson. Those who answer these questions will receive subsequent issues of lessons. These lessons are published by the College of Agriculture, Cornell University.

The reading lessons now cover three principal topics: the soil and the plant; dairying and cattle feeding; fruit growing. The subject-matter of these lessons will be of the nature of review work for some, while to others the principles as such will be new. I trust they will be interesting and useful to all.

Address Farmers' Reading Course, Cornell University, Ithaca, N. Y. John Craig, Supervisor Farmers' Reading Course.]

[Third edition. Cornell reading course for farmers. Quiz on reading lesson No. 1. November, 1900. By John W. Spencer. Revised by John Craig.]

[These questions constitute a supplement to reading lesson No. 1 (the soil: What it is). Its purpose is to induce the reader to think carefully about what he reads. Answer the questions as best you can and return this sheet to us (2 cents postage). We want these answers in order that we may know what interest you are taking in the reading course and how much good you are getting from it, and we want to help you when you do not understand the problems involved. We are after results, and do not care about the handwriting nor the grammar. These answers are for our own examination and are not to be made public. We should be glad of any comments on these lessons.

It is hoped that readers will form themselves into little clubs to meet once or twice a month to discuss the problems raised by the lessons.

Those who answer the questions will receive future lessons.]

What is the influence of weather upon soft, slaty rock jutting out on embankments and in railroad cuts?

Have you ever taken a glass of water from a flowing stream after a heavy rain and allowed it to stand until the sediment has settled? What is this sediment?

Imagine a branch of this stream bringing rotted slate rock and another bringing fine sand. When mixed in the main stream and deposited on some bar or overflowed field what kind of soil would the mixture make?

What is inorganic matter?

What is organic matter?

Why are soils from which a thrifty forest growth has been removed capable at once of producing good farm crops?

How are lichens (sometimes called "mosses") enabled to grow on bare rock or on a tombstone?

If any great amount of lichen should become mixed with the disintegrated rock, would it be humus and form a weak soil that might produce an order of plants a little larger and stronger than lichen? Explain.

As the higher order of plants come in and die down and mix with the soil, would the process increase the productive power of the soil? How?

In instances in which soil has been removed by grading, could a new soil be well made by adding commercial fertilizer alone? What would you apply first to such land?

If humus in soil under cultivation is perishable, ought it not to be the farmer's first care to keep good the quantity first found in the virgin soil?

In addition to the humus returned to the soil in manure, from forage fed to stock, and by plowing under stubble and roots, do you think it a good plan to sow some cover-crop in corn rows at last cultivation, and on oat and wheat stubble as soon as the crop is off, for plowing under the following spring? Have you tried this plan and with what results?

What are good crops for this purpose?

Which of these are leguminous plants? Name all the kinds of leguminous plants you know.

Why is it advised to plow under the green crops as soon as the land can be worked in the spring?

Do you think a rotation of crops helps the soil to bear the strain of successive cropping? If so, why?

What is a so-called "worn out" soil?

How is your soil made an active laboratory in which changes will take place and some of this unavailable plant food be made usable?

When the texture of your soil is poor, or, in other words, when your laboratory is out of order, will the best commercial fertilizers or stable manures give good results?

Why are heat and air important agencies in the changes going on in the soil, as they also are in the changes in a barrel of cider or in the yeast in a pan of dough?

Does standing water on soil have a detrimental or beneficial effect on the heat and air? Why?

How can you make the soil laboratory do the best work?

THE WITNESS. A leaflet was printed on "How the Plant Gets Its Food From the Soil." This is found in Cornell reading course for farmers No. 4, by B. M. Duggar. The quiz on this lesson, No. 4, is by L. H. Bailey.

(The lesson and quiz referred to are reprinted below.)

[Cornell reading course for farmers. Issued by College of Agriculture, Cornell University, Ithaca, N. Y., in the months of November, December, January, February, and March. Reading lesson No. 4. February, 1901. Second edition. By B. M. Duggar.]

HOW THE PLANT GETS ITS FOOD FROM THE SOIL.

1. *Roots feed obscurely.*—The poultry yard is the proper place to observe how the chicken takes its food and drink, but garden observations alone do not furnish us equal evidence concerning the garden plant. Everyone knows that the plant takes water and soluble substances from the soil by certain root structures, but the facts about the interesting activities of these roots too often remain a secret of the soil. These activities may seem obscure, but let us handle the plant, make a few simple experiments, and see what the study yields. In this study we are concerned with the one question of how the plant gets the water and other food materials from the soil, disregarding entirely the various kinds of substances that may be used as food.

2. *There are roots and there are rootlets.*—In figure 1 we have a radish plant ready for the table. It has developed no seeds, but it has stored up food; and for present purposes we may consider it a mature plant. To begin with, observe how its root system is constructed.

The plant has been pulled out of the soil in which it was growing. The large fleshy root terminates in a common-sized root (*a*) to which little rootlets (*b*) are attached. Then there are little rootlets (*b'*) attached to the fleshy root at various places near the base; and this we expected, knowing that the fleshy root is nothing but the enlarged taproot. But the rootlets which we so readily see are only intermediary, and there are numerous yet smaller structures which we do not see at all when we handle the plant so roughly.

3. *The rootlets are clothed with hairs (root hairs) which are very delicate structures.*—Next we will carefully germinate some radish seed so that no delicate parts of the root will be injured. For this purpose we simply sow a few seed in packing moss or in the folds of some black cloth, being careful to keep them moist. In a few days a seed has germinated, the root has grown an inch or two, and branched once or twice perhaps. Lift the moss carefully, or open the folds of the cloth. Fig. 2 shows what may be found. Now notice that at a distance of about a quarter of an inch from the tip the root is covered with a delicate fringe of hairs. They are actually hairs; that is, root hairs. Touch them and they collapse, they are so delicate. Dip one of

1. Radish.

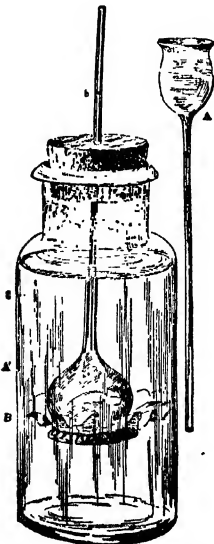

2. Root hairs of radish.

the plants into water, and when removed the hairs are not to be seen. The water mats them together along the root and they are no longer evident. No wonder we can not see root hairs well when a plant is pulled out of the soil, be it done ever so carefully! The delicate root hairs clothe the young rootlets, and we can hardly estimate what a great amount of soil is thus brought into actual contact with the plant. The value of this contact we shall soon see. Root hairs are not young roots.

4. *The rootlet and the root hair differ.*—The rootlet is fleshy in its way—a solid, compact structure. The root hair is a tubular-plant cell; that is, a delicate little tube, within the cell wall of which is contained living matter (protoplasm); the cell wall and the lining membrane of this wall permits water and substances in solution to pass in by a very interesting physical process. Being long and tubelike, these root hairs are especially adapted for taking in the largest quantity of solutions; and they are, in fact, the principal means by which water and plant food are absorbed from the soil, although the surfaces of the rootlets themselves do their part. Water plants do not need an abundant system of root hairs, and such plants depend largely upon their rootlets.

5. *A salt solution separated by a membrane from water absorbs some of the water and increases its own volume.*—To understand better how the root hairs absorb their water, we will study that physical process already mentioned. First dissolve 1 ounce of saltpeter, which we may use as a fertilizer solution, in 1 pint of water, calling this solution I. For use in some experiments later on also dissolve a piece of saltpeter

not larger than a peach pit (about one-seventh ounce) in about 1 gallon of water, calling the latter solution II. Now, fill the tube A in fig. 3 almost full of the strong solution I, and tie a piece of animal membrane (hog's bladder is excellent for this purpose) over the large mouth. A small funnel, with a long stem, may be used if one can not obtain a tube like A. Then sink the tube, bladder part downward, into a large bottle of water until the level of liquid in the tube stands at the same height as that in the bottle C. The tube may be readily secured in this position by passing it through a hole in the cork of the bottle. In a short time we notice that the liquid in A' begins to rise, and in an hour or so it stands as at b, say. This is an important result; see that we do not forget it, for it explains many things. The facts are that the liquids diffuse. Pure water in both vessels would pass both in and out equally, but the salt in solution in A' diffuses very slowly. Since the slower diffusible salt replaces a part of the readily diffusible water, the total water coming in will be greater than the total fluid going out. Then there is evidently absorption of water and pressure in A', which forces the liquid up higher than in C. The liquid in A' would continue to stand higher than in C while this absorption goes on, or until the salt becomes equally diffused. Thus we know that a strong

3 How to illustrate osmosis.

4 Killed by too much food.

fertilizer solution, or any solution denser than water, separated from water by a membrane, will absorb water. This is an instance of that which physicists have named osmosis. It is osmotic action.

6. *The cell sap of the root hair absorbs water from the soil by osmotic action.*—The experiment above detailed enables us to understand how the countless little root hairs act, each one like the tube A', if only the whole surface of the tube A' were a bladder membrane, or something acting similarly! The soil water does not contain much of the land's fertility; that is, it is a very weak solution. The active little root hair, on the other hand, is always filled with cell sap, a more concentrated solution; hence soil water must be absorbed.

7. *The plant absorbs fertilizer solutions as long as they are used for the growth of the plant.*—The fertilizers (salts) which are dissolved in the soil water also diffuse themselves, although slowly, through the membrane of the root hairs, each ingredient tending independently to become as abundant inside the root hair as outside in the soil water, or to be in equilibrium within and without. Now, once inside the root hair, these absorbed fertilizer solutions pass on to root and stem and leaf to be utilized in growth. As long as they are used up, however, more must come into the root hairs, in order to restore the equilibrium. Thus those substances which are needed must come in as long as the land can furnish them in a soluble form.

8. *Fleshy pieces of root or stem will absorb water from weak solutions and become rigid; in strong solutions such fleshy parts will give up their water and become flexible.*—We have illustrated absorption by an artificial arrangement because the root hairs are so small that they can not be seen readily. But all parts of the root, even the fleshy part, can absorb some water; and to experiment further with this principle of absorption, we cut several slices of potato tuber about one-eighth of an inch in thickness, and let them lie in the air half an hour. Put a few of these slices into some of the strong fertilizer solution I, such as was used in A', fig. 3. Put other similar pieces into some of the very weak solution II. In about half an hour or more we find that those pieces in the weak solution are very rigid or stiff (turgid). They will not bend readily when held lengthwise between the fingers. Compare these slices with those in the strong solution, where they are very flexible (flaccid). This bending is evidently due to the fact that those in the strong brine have actually lost some of their water. So the potato tuber could take in soil water from a solution which had dissolved a small amount of food; but put in too much such food material and the potato would actually lose some of the water which it held.

The experiments which have been made not only demonstrate how the roots absorb water containing plant food, but they emphasize the fact that the outside solution must be very dilute in order that water may be absorbed at all. The root hairs, then, absorb water which has dissolved only a small amount of plant food from the richness of the soil, and not such rich solutions as the sap of the plant itself, and when solutions are absorbed each salt is taken up.

9. *The plant may be wilted, and even killed, by attempting to feed it fertilizer solutions which are too strong.*—More carefully to test this matter relating to the use of strong solutions, we may make a very simple experiment. Secure a young radish plant (or almost any seedling with several leaves) and insert the roots into a small bottle containing some of the saltpeter solution I. In another bottle we put a similar plant with some of the weak solution II. Support the plant in the mouth of the bottle with cotton batting. After standing for a few hours or less it will be noticed that the leaves of the plant in the strong fertilizer solution begin to wilt, as in fig. 4. The plant in the weak fertilizer solution, fig. 5, is perfectly rigid and normal. This further indicates that the growing plant is so constituted as to be able to thrive

5. Thriving in a weak solution.

6. Root prints in marble. The upper part represents the sawdust soil, turned back.

upon very dilute solutions only. If we attempted to feed it strong fertilizer solutions, these strong solutions would act injuriously, as they would take water from the plant, causing it to wilt. In fact, saltpeter seems to be most available for plant food when 1 ounce is dissolved in about 7 or 8 gallons of water.

10. *The injurious effect of strong fertilizer solutions is known in practice.*—In everyday practice we are already familiar with the fact above demonstrated. Everyone recognizes the value of wood ashes as a fertilizer; but no one would dare water his

valuable plants with lye, or sow his choice vegetable seeds on an ash bank, however well it might be watered. If there is a potted plant at hand which is of no value we might remove some of the soil, add considerable wood ashes, water well, and await the result. Try it; or give it a lump of nitrate of soda.

11. *The soil water is a very dilute solution.*—In reading lesson No. 2 the different kinds of water in the soil were mentioned, and it was stated that the water which is valuable to the plant is not the free water, but the thin film of moisture which adheres to each little particle of soil. Anyone who has drunk water from a tile drain knows that at least the free water which has soaked from the soil must contain relatively very little plant food, else our delicate taste would detect it. Perhaps the film moisture contains a little more plant food than the free water, but the quantity of substances in solution is generally extremely minute, so that the soil water is readily absorbed by the plant.

12. *Root absorption may continue in a soil that seems to be dry.*—Not only is free water unnecessary for ordinary land plants, but the amount of film moisture present does not need to be very great. It is remarkable how dry a soil may feel to the fingers and yet afford sufficient water to maintain the plant. This may be readily studied with a potted plant or observed in the field.

13. *The roots need air.*—Corn on a piece of land which has been flooded by the heavy rains loses its green color and turns yellow. Besides diluting plant food, the water drives the air out of the soil, and this suffocation of the roots is very soon felt in the general health of the plant. The film moisture alone (hygroscopic water) is best to insure proper aëration. The value of tillage for aëration purposes has already been mentioned in reading lesson No. 2. Water plants and bog plants have adapted themselves to their particular conditions. They either get their air by special surface roots or get it from the water.

14. *The root must be warm in order to perform its functions.*—Should the soil of fields or greenhouses be much colder than the air, we would find a very bad state of affairs for the plant. When in a warm atmosphere, or in a dry atmosphere, plants need to absorb much water from the soil, and the roots must be warm in order that the root hairs may be so active as to supply the water as rapidly as it is needed. If the roots are chilled, then the plant will wilt. We may try this experimentally with two potted plants, as radish, colens, tomato, etc. Put one pot in a dish of ice water and the other in a dish of warm water, and keep them in a warm room. In a short time notice how stiff and vigorous is the one whose roots are warm. Perhaps the one whose roots are chilled is already beginning to show signs of wilting.

15. *Roots excrete substances which aid in dissolving plant food from some soil compounds which are insoluble in water.*—Ordinarily there would be in solution in soil water only those substances which are soluble in the water alone. The plant is not only provided for absorbing what is already there in a soluble form, but it is also capable of rendering soluble small quantities of the insoluble substances present in the soil, and which may be needed for plant food. The plant accomplishes this purpose by means of certain excretions from the roots. In other words, not only does the plant absorb dilute solutions, but it gives off through its root-hairs small quantities of acid substances, particularly carbonic acid and an acid phosphate.

These acid substances may even etch marble. Fig. 6, from Bailey's *Principles of Agriculture*, illustrates this. "On a polished marble block, place a half inch of sawdust, in which plant seeds. After the plants have attained a few leaves, turn the mass of sawdust over and observe the prints of the roots on the marble." These prints will be very faint.

We believe that special credit should be given those who carefully and conscientiously answer and return these quizzes. We are now considering the advisability of establishing a system whereby this may be done. This would enable us to give those who complete the 3 years' course a certificate of graduation, which should be regarded as a reward of earnest effort and a mark of the reading and thinking farmer.

The reading course covers 3 years' study. There are 3 series of reading, each consisting of 5 lessons, and a review containing the correct answers asked on these lessons.

Series A discusses the soil and the plant.

Series B takes up cattle-feeding problems.

Series C is devoted to the principles of fruit growing.

New readers should begin with Lesson 1, Series A. The lessons are published by the College of Agriculture, Cornell University, under the auspices of the Agricultural College extension fund.

[Cornell reading course for farmers. Quiz on reading lesson No. 4. February, 1901. By L. H. Bailey.]

[These questions constitute a supplement to reading lesson No. 4 ("How the plant gets its food from the soil"). Its purpose is to induce the reader to think carefully about what he reads. Answer the questions as best you can and return this

sheet to us (2 cents postage). We want these answers in order that we may know what interest you are taking in the reading course and how much good you are getting from it; and we want to help you when you do not understand the problems involved. We are after results, and do not care about the handwriting nor the grammar. These answers are for our own examination and are not to be made public. We should be glad of any comments on these lessons. Those who answer the questions will receive future lessons.

When lesson No. 5 shall have been digested we hope to send you a supplementary lesson answering questions in all 5 lessons, and also suggesting how you may find out what fertilizer your soil and crops need.

A reading course for farmers' wives has been organized. It is a companion course to this one. Those women who wish to join the course should send in their names at once in order to receive the first lesson.]

1. Do the root hairs finally become roots, or do they stay on as the main root grows?
2. Are there root hairs on old roots?
3. On what part of the roots are the root hairs?
4. Where does the radish plant, which you grow in moss or between folds of cloth, get nourishment for making the root hairs?
5. Why do particles of soil adhere to a young plant of wheat or cabbage when it is pulled up?
6. What do you understand by solution?
7. Give an example of a substance which will dissolve in water and one which will not.
8. May materials which are insoluble in rain water be soluble in soil water? Why? (Consult lesson 3.)
9. Must all food materials in the soil be in solution before the plant can use them?
10. Does warming the water increase its power to make substances soluble?
11. Write a definition of osmosis. (Consult dictionary or some schoolbook on physics or natural philosophy.)
12. Why does the soil water go into the root hair?
13. Why does not the liquid in the root hair flow out abundantly into the soil?
14. What would happen if the liquid in the root hair and that in the surrounding soil were of equal density and constitution?
15. How is it that plants can live and grow in a soil which is dust dry?
16. Can your soil be so loose as to have too much air for the good of the plants?
17. Do you understand that you can smother the root as well as the top of the plant? How?
18. At what season do you suppose that corn roots absorb the most moisture?
19. At what season do you have the least rainfall?
20. If you knew that you would not have sufficient rainfall in August to maintain your potato crop, how would you plan to secure the moisture?
21. Name one way in which plants are injured by too strong dressings of potash or nitrogen?
22. If all the potash in your cornfield were to become suddenly available, what would happen?

23. How might you apply muriate of potash so that strawberry plants would be injured?

24. Would it be an easy matter to injure old apple trees by muriate of potash? Why?

25. If you put the fertilizer in the hill, will not the roots grow beyond and away from it, as the plant grows?

(Post-Office) _____.

The WITNESS. Lessons are not only written on the soil and what it contains, but also on how the plant gets its food from the soil and how it gets its food from the air. Reading lesson No. 5, by B. M. Duggar, is a good sample of the leaflets which are prepared on various subjects. The quiz on reading lesson No. 5 may serve to indicate how the instruction is carried on. About 20,000 copies constitute an edition. (The lesson and quiz referred to are reprinted below:)

[Cornell reading course for farmers. Issued by College of Agriculture, Cornell University, Ithaca, N. Y., in the months of November, December, January, February, and March. Reading lesson No. 5, March, 1901, by B. M. Duggar. Second edition.]

HOW THE PLANT GETS ITS FOOD FROM THE AIR.

NOTE.—In this treatment of the relation of the plant to the air only the higher or agricultural plants are referred to

1. *Charcoal is largely carbon, and carbon enters abundantly into the composition of all plants.*—Half or more of the bulk of the tree, aside from water and the elements of water, is carbon. When the tree is charred (or incompletely burned), the carbon remains in the form of charcoal. The ordinary cultivated plant has but two sources from which to obtain food—the air and soil. In a corn plant of the roasting-corn stage the water forms about 80 per cent of the structure. There is, then, about 20 per cent of dry matter remaining after the water has been driven off. In order to form some idea of what portion of the plant structure comes from the air, note that when such a corn plant is burned in air the amount of ash remaining is about 1 per cent of the total substance. This ash consists of practically all of the fertilizers which we found in reading lesson No. 3 to come from the soil with the exception of the nitrogen. The entire nitrogenous product forms about 2 per cent of the total green substance. It was driven off by the burning. Next note what happens when a plant is burned without free access of air, or smothered, as in a charcoal pit. The mass of charcoal resulting is almost as large as the body of the plant. Carbon is the element now present which was not present in the ash.

Charcoal is almost pure carbon, the ash present being so small in proportion to the large amount of carbon that we look upon the ash as an impurity. The fact is that the carbon and the elements of water (hydrogen and oxygen) make up more than 90 per cent of the dry matter of the corn plant.

The percentage of dry matter which comes from the soil may seem absurdly small, for we are constantly engaged in supplying fertilizers to the soil and never seem to trouble ourselves about this important substance, carbon. It was an interesting fact that the carbon went off as a gas when the plant was burned in air. The carbon did not go off alone, but it went off in connection with oxygen and in a form called carbon-dioxide gas, CO₂.

2. *The air contains a small percentage of carbon dioxide, but oxygen and nitrogen are the abundant elements.*—The green plant must get its carbon from the air. In other words, much of the solid matter of the plant comes from one of the gases in the air. The air contains only about four-tenths of 1 per cent of carbon dioxide. It would, however, be very disastrous to animal life if this percentage were much increased.

Carbon dioxide is often called "foul gas." It may accumulate in old wells, and an experienced person will not descend into such wells until they have been tested with a torch. If the air in the well will not support combustion, that is, if the torch is extinguished, it usually means that no wise man would care to breathe such air. The air of a closed schoolroom often contains far too much of this gas along with little particles of solid carbon.

3. *The carbon dioxide of the air readily diffuses into the leaves and other green parts of the plant.*—The leaf is delicate in texture, and often the air can enter directly into the leaf tissues. There are, however, special inlets provided for the diffusion of gases into the leaves and other green parts. These inlets consist of numerous pores (stomates or stomata), which are especially abundant on the under surface of the leaves. The apple leaf contains about 100,000 of these pores to each square inch of

the under surface. Through these stomates the outside air enters into the air spaces of the plant and, finally, into the little cells containing the living matter.

4. *The green color of leaves is due to a substance called chlorophyll.*—Purchase at the drug store about a gill of the poison, wood alcohol. Secure a leaf of geranium or of any convenient plant which has been exposed to sunlight for a few hours and put it in a white cup with sufficient alcohol to cover the leaf. Place the cup on the stove where it is not hot enough for the alcohol to take fire. After a time the coloring matter is all dissolved by the alcohol, which has become an intense green. This green coloring matter is dissolved chlorophyll. Save this leaf for a future experiment.

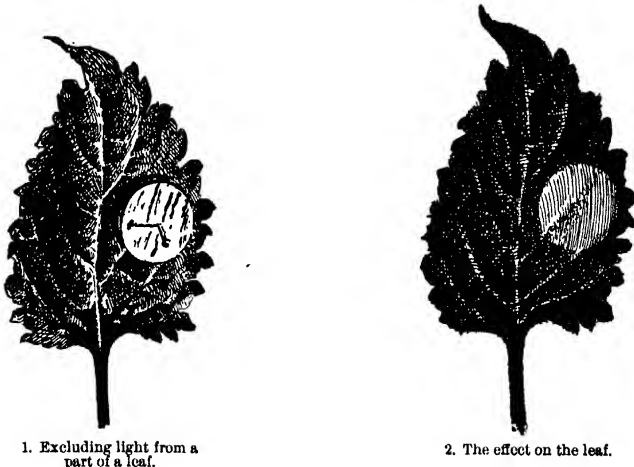

In the living plant this chlorophyll or leaf-green is scattered throughout the green tissues in little oval bodies, and these bodies are most abundant near the upper surface of the leaf, where they can secure the greatest amount of light. Without this green coloring matter there would be no reason for the large flat surfaces which the leaves possess, and no reason for the fact that the leaves are borne most abundantly out at the ends of branches, where the light is most available.

5. *Plants grown in darkness are yellow and slender and do not reach maturity.*—Compare the potato sprouts which have grown from a tuber lying in the dark cellar with those which have grown normally in the bright light. The shoots from the cellar are yellow and slender. They have reached out for that which they can not find, and when the carbon which is stored in the tuber is exhausted, these shoots will have lived useless lives.

A plant which has been grown in darkness from the seed will complete its life even in its infancy, although for a time the little seedling will grow very tall and slender. Light encourages the production of this green color; and it is evident that the light and this green color together have to do with the utilization of the carbon dioxide of the air.

6. *Carbon dioxide is absorbed by the leaf during sunlight and oxygen is given off.*—Some proverbs are founded on facts. It is true that plants purify the air during the day. Under the influence of sunlight and the green color of the foliage, the carbon dioxide which enters into the leaf is absorbed by the living parts, and with this absorption of carbon dioxide there is given off oxygen, which is necessary at all times to sustain life.

Very careful experiments have shown that carbon dioxide is absorbed and that oxygen is given off by all green surfaces during the hours of sunlight. How this carbon dioxide, which is thus absorbed, may be used as food is a question of much interest.

1. Excluding light from a part of a leaf.

2. The effect on the leaf.

7. *Chlorophyll absorbs the energy of the sun's rays and the energy thus obtained is used by the living matter in uniting the carbon dioxide absorbed from the air with some of the water brought up by the roots. The process by which these compounds are united is a complex one, but the ultimate result is starch.*—The snow on black soil melts quickly because the black absorbs the heat of the sun. The green chlorophyll of the leaf absorbs the energy of the sunlight, and this energy affords a peculiar vital force which enables the living matter of the leaf to unite carbon dioxide and water. No one knows all

the details of this process; and our first definite knowledge of the product begins when starch is deposited in the leaves.

Starch is composed of carbon, hydrogen, and oxygen ($C_6H_{10}O_5$). The sugars and the woody substances are very similar to it in composition. All these substances are called carbohydrates.

In making this starch from the carbon and oxygen of carbon dioxide and from the hydrogen and oxygen of the water there is a surplus of oxygen. It is this oxygen which is given off into the air.

The process of using the carbon dioxide of the air is known as carbon dioxide assimilation, or photosynthesis.

8. *Starch is present in the green leaves of plants which have been exposed to sunlight; but in the dark no starch can be formed from carbon dioxide.*—Procure at the drug store an ounce or so of tincture of iodine, dilute this considerably and pour a drop or two on some ordinary starch paste or a slice of potato. The starch is colored blue or purplish-brown. This reaction is characteristic of starch. Now pour some of the iodine on the leaf from which we dissolve the chlorophyll in a previous experiment (p. 3). Note that the leaf is colored purplish-brown throughout. The leaf contains starch.

Secure a leaf from a plant which has been in the darkness for about 2 days. Dissolve the chlorophyll as before, and attempt to stain this leaf with iodine. No purplish-brown color is produced. A leaf kept in darkness contains no starch.

This demonstration may be made much more instructive in another way. Secure a plant which has been kept in darkness for 24 hours or more. Split a small cork and pin the two halves on opposite sides of one of the leaves, as shown in fig. 1. Place the plant in the sunlight again. After a morning of bright sunshine dissolve the chlorophyll in this leaf with alcohol, as before; then stain the leaf with the iodine. Notice that the leaf is stained deeply in all parts except in that part over which the cork was placed as in fig. 2. There is no starch in this area. These experiments also make it evident that the starch manufactured in the leaf may be entirely removed during darkness.

9. *Plant or parts of plants which have developed no chlorophyll can form no starch.*—Secure a variegated leaf of coleus, ribbon grass, geranium, or of any plant showing both white and green areas. On a day of bright sunshine test one of these leaves by the alcohol and iodine method for the presence of starch. Observe that the parts devoid of green color have formed no starch. However, after starch has once been formed in the leaves, it may then be changed and removed, to be again formed as starch in other parts of the living tissues.

10. *Starch is in the form of insoluble granules—Whenever the material is carried from one part of the plant to another for purposes of growth or storage, it is changed to sugar before it can be transported.* When this starchy material is transferred from place to place, it is made soluble, changed into sugar, by the action of a ferment. This is a process of digestion. It is much like the change of starchy foods to sugary foods by the saliva of the mouth.

After being changed to the soluble form, this material is ready to be used in growth, either in the leaf, in the stem, or in the roots. With other complex products it is then distributed throughout all of the growing parts of the plant; and when passing down to the root it passes more readily through the inner bark, in plants which have a definite bark. This gradual downward diffusion of materials suitable for growth through the inner bark is the process referred to when the descent of sap is mentioned.

11. *The food from the air and the food from the soil unite in the living tissues.*—The sap constantly passing upward from the roots during the growing season is made up largely of the soil water, along with the salts which have been absorbed in dilute solutions. This upward-moving sap is conducted largely by certain tubular cells of the young wood or of the woody bundles. These cells are never continuous tubes from root to leaf; but the water passes readily from one cell to another in its upward course.

The upward sap gradually passes to the growing parts, and everywhere in the living parts, particularly in the leaves and other assimilatory tissues. It meets the product of photosynthesis. Under the influence of the living matter of the plant, this product from the leaves may unite with the nitrogen. A substance more complex than sugar is then formed, and gradually compounds are formed which contain sulphur, phosphorus, potassium, and other elements, until finally living protoplasm is manufactured. Protoplasm is the living matter in plants. It is in the cells, and is usually semifluid.

12. *Starch and other products may be stored up during one growing period to be used during the next season.*—Although a plant strives to make a full amount of growth each season, it must also provide itself for developing a new crop of leaves and of fruit the next year, if it is to live more than a single season. It must also provide

for its offspring. Tubers (white potato), stems (cacti), and roots (sweet potato) generally serve as storage organs for food. Thick, fleshy leaves, as in the century plant, which live during many seasons, may also serve as storage organs.

The peach tree blossoms and sets its fruit usually before the leaves are open. In fact, the food stored up one season has a most important influence in determining the crop of the next year. Bearing this in mind, one appreciates the value of keeping the leaves free from fungous and insect injuries throughout the growing season.

13. *Plants need oxygen for respiration, just as animals do.*—So far we have referred especially to the carbon dioxide of the air. To most plants the nitrogen of the air is inert, and only serves to dilute the other elements; but the oxygen is very necessary for all life. We know that all animals need this oxygen in order to breathe or respire. In fact, they have become accustomed to it in just the proportions found in the air, and this is now best for them.

When animals breathe the air once they make it foul, because they use some of the oxygen and give off more carbon dioxide. Likewise all parts of the plant must have a constant supply of oxygen. Roots need it, and this has already been emphasized in reading lesson No. 4.

The oxygen passes into the air spaces and into the living protoplasm, entering into chemical combinations, the end product of which is carbon dioxide, as in animals. It is interesting to note that the air spaces in the leaf are equal in bulk to the tissues themselves. As a result of the use of this oxygen alone at night, plants give off carbon dioxide just as animals do. Plants respire; but since they are stationary and more or less inactive they do not as a rule need so much oxygen as animals, and they do not give off so much carbon dioxide.

During the day plants use so much more of the foul gas carbon dioxide than of oxygen that plants are said to purify the air. The carbon dioxide which plants give off at night is very slight in comparison with that given off by animals; so that a few plants in a sleeping room need not disturb one more than a family of mice, perhaps. Plants usually grow most rapidly in darkness.

14. *The plant has an important connection with the water vapor of the air.*—In addition to obtaining much of its food supply from the air, the plant has an important relation to the humidity of the atmosphere. Cut off a succulent shoot of any plant, stick the end of it through a hole in a cork, and stand it in a small bottle of water. Invert over this bottle a large-mouthed bottle (as a fruit jar), and notice that a mist soon accumulates on the inside of the glass. In time drops of water form. The plant gives off water from its leaves and from other succulent parts.

It has been mentioned that the plant takes its food from the soil in very dilute solutions. Then much more water is absorbed by the roots than is used in growth; and it is this surplus water which is given off from the leaves into the atmosphere by an evaporation process known as transpiration.

Transpiration takes place more abundantly from the under surfaces of leaves and through the pores or stomates. It has been found that a smilflower plant of the height of a man during an active period of growth gives off more than a quart of water per day. A large oak tree may transpire 150 gallons per day during the summer. For every ounce of dry matter produced it is estimated that from 15 to 25 pounds of water must pass through the plant.

15. *When the roots fail to supply to the plant sufficient water to equalize that transpired by the leaves, the plant wilts.*—Transpiration from the leaves and delicate shoots is increased by all of the conditions which would increase evaporation, such as higher temperature, dry air, wind, etc.

The stomates are so constructed that they open and close with the varying conditions of the atmosphere, attempting to regulate transpiration. However, during periods of drought or of very hot weather, and especially during a hot wind, the closing of these stomates can not sufficiently prevent evaporation. The roots may be very active, and yet fail to absorb sufficient moisture to equalize that given off by the leaves. As an ultimate consequence of this the plant wilts. Any injury to the roots, or even chilling them, may cause the plant to wilt. On a hot, dry day note how the leaves of corn "roll" toward afternoon. Early the following morning note how fresh and vigorous the same leaves appear.

The wilting of a plant is due to the loss of water from the cells. The cell walls are soft, and collapse. A rubber balloon filled with air or water is firm and rigid. In the woody parts of the plant the cell walls may be stiff enough to support themselves, even though the cell is empty.

[Cornell reading course for farmers. Quiz on reading lesson No. 5. March, 1901. By L. H. Bailey.]

[These questions constitute supplement to reading lesson No. 5 ("How the plant gets its food from the air"). Its purpose is to induce the reader to think carefully about what he reads. Answer the questions as best you can and return this sheet to us (2 cents postage). We want these answers in order that we may know what

interest you are taking in the reading course and how much good you are getting from it; and we want to help you when you do not understand the problems involved. We are after results, and do not care about the handwriting or the grammar. These answers are for our own examination and are not to be made public. We should be glad of any comments on these lessons. This is the last regular lesson for this season.

Next month we hope to send you a supplementary lesson containing correct answers to all the questions in the 5 lessons. It will also offer suggestions as to how to experiment to find out what fertilizer your soil needs. Some general remarks will be made respecting the results which have been attained in the reading course.]

What proportion of its substance does the plant secure from the soil?

What one substance or compound is taken in most profusely by the plant?

How does the plant get its water—through roots or leaves?

In what part of the plant does the water ascend—through the young wood or between the bark and wood?

Where does the plant get its carbon?

How does it take in its nitrogen—by roots or leaves?

Where is the starch manufactured?

From what substance is the starch made?

Of what elements is starch composed?

Into what is the starch largely changed before it is transported?

What use is made of the sugar-containing material during transportation?

Through what part of the plant does this carbonaceous material (or "elaborated sap") pass?

The root takes in water containing food: Can it use this food material directly in making root growth? Explain.

Why is starch stored in seeds and tubers?

Is starch stored in twigs in the fall?

Are the flowers of peaches and other early blooming plants fed from food taken in at the root at the time, or from materials stored in the twig? (Think how the potatoes sprout in the bin.)

Will mulching the roots of a peach tree with straw when the ground is frozen delay the blooming in the spring?

Soil water holds very little food for plants; the roots must take in enormous quantities of water. What becomes of some of this water?

Is the water which evaporates from the soil of any direct use to the plant?

The plant needs water, it sweats it out (transpires). How shall we manage so that the plant can have all the water it needs?

Write down all the *substances* (or materials) you know which the plant must have in order to live and grow.

Which one of these does nature supply in sufficient abundance, without any thought on your part?

What ones can you help nature to supply?

Name all the congenial *conditions* (or agencies) which the plant must have in order to be comfortable and to grow.

What ones of these can you help nature to supply or maintain?

(Name) _____,
Post-Office _____.

The WITNESS. The Life History of the Toad was the first leaflet issued on animal life. The object in printing this leaflet was to interest the teachers, and to illustrate how one of the most common (to some repulsive) animals could be used to interest children in the study of animal life, and to impart a desire for information. A most interesting leaflet by Anna Bostford Comstock, *Some Tentmakers*, has gone to several editions. If I should select one that has attracted most attention it would be the first one named.

Q. (By Mr. PHILLIPS.) Have you anything further to add?—A. Since we are studying agricultural education, I think it might be well to call your attention to the fact that one man on the farm, by reason of horse power and labor-saving implements, is now able to produce from 4 to 10 times as much as one man could in the early days. Corn is now raised entirely without the use of the hoe; formerly it was not only planted with the hoe, but hoed from 3 to 5 times during the season. Formerly but 1 horse or ox, or at most 2, were used to till the soil; now it is not uncommon to see 5 or 6 horses hooked to a gang plow. One horse when used in tilling the soil is equal to about 10 men, and the cost of its labor is about one-half that of a man, so each additional horse that can be used to advantage in the team multiplies the real power of the man from 10 to 20 times. Economy in the use of machinery and horses is best illustrated in the harvest fields of the great wheat districts. From 26 to 30 animals are not infrequently hitched to a combined machine which cuts, thrashes, and cleans from two to four thousand bushels of wheat per day. But 3 to 4 men are required to operate this harvester. It will be seen how great is the economy in these modern days on the farm as compared with the early days when the wheat was reaped with sickles and thrashed with flails and cleaned with the winnowing basket.

I believe these and similar factors have so economized human labor on the farm that only about one-fourth to one-tenth as many men are required to produce a given amount of food and clothing products as formerly, and that herein lies the great reason for the tendency of the boy to leave the farm for the city.

(Testimony closed.)
